The AVC circuit is usually a long string that can be disconnected in sections. It sounds like you have been doing that. I think one problem I had like you are having was when a mica coupling cap in the if stage was bringing in a small positive leakage into the avc circuit. I kept addressing the avc circuit, but it was not there at all. Sort of a Trojan Horse.

The good thing about this is that you will feel very good when you find the problem. Enjoy the old receiver.

Good luck.

73, Colin K7FM

Along with all the normal events that take place at the Charlotte
Conference, this year we will be auctioning the collection of museum
quality, rare collectible radios and accessories that belonged to our
dear friend Ernie Hite WB4KFL.
Click on this link to visit the 2010 Charlotte Conference
web page, http://charlottearc2010.homestead.com/index.html
Not only are there lots of rare radios from the 1920s
there are 4 nearly mint communications receivers
in the collection, R-388, GPR-90, SX-115 & SP-600.

73, Ron w4ron
Charlotte Conference chairman

I redrew the circuit. The AVC circuit is fairly conventional. The AVC voltage comes from the detector and the second half of the 6H6 is used to generate a "delay" voltage to prevent the AVC from acting until the signal strength reaches a certain minimum level. This is done to maintain the RF and IF stages at full gain. There is a negative bias supply obtained from a series of resistors in the center-tap return of the rectifier. The RF gain voltage comes from the RF gain control which is in this string.

About the only way I can see for a positive voltage to appear on the AVC-RF gain bus is if this whole string is being pulled positive. If that's so it should also show up on the audio tubes which are biased from this source. Unless you made a gross error in wiring I would be suspicious of C-96 and C97, the first two filter caps since they are returned to the top of the negative supply rather than to chassis ground. C-98, the last cap, goes to chassis ground so can't cause trouble. If one or both of the the filter caps is leaky it could be pulling the negative supply to a positive value.

I wouldn't worry about gassy tubes. Positive voltage can come from one of the controlled tubes becoming gassy but they are pretty well isolated in this circuit. I can't account for the slight AVC action with the AVC switch in manual but if the negative supply has been pulled positive it might affect this.

The AVC switch essentially shorts out the AVC and puts the controlled stages directly on the negative supply. However, the whole AVC bus floats on the negative supply so that the RF gain control works in both AVC and Manual.

I certainly agree with those who suggest going over your work carefully. If you know another knowlegible person have them look also since its possible for someone to overlook the same thing over and over where someone else will spot it right away. But, check the filter caps first.

Many years ago I remember having a receiver that used a metal 6V6 in the audio output.
It ran stinking hot so I replaced it with a 6V6G.
This ran much cooler!

Good question. Also if there is 18 volts across the cathode resistor
and it measures within limits (immediately after switching off i.e.
hot) that will allow calculation of the cathode current being drawn by
the tube or tubes.

Noticed there is a guy in UK, Dorset I think, who is currently ebaying
some NOS AR88 coils, and maybe some knobs? He MIGHT have some other
bits????
If you can't find it email me (or here) and I'll try and help. Ain't
the internet a big help? Good luck.

You should probably post again, as a separate thread.

It'd probably be a good idea to mention some specific parts or classes of
parts you're looking for -- mechanical? power inductors? knobs? etc.

Push-pull stages do not have to be Class-A but often are. There are advantages in stability and lower distortion. The reason for biasing toward Class-B is to increase efficiency. A pair of 6F6 tubes running Class-A will put out about 10 Watts while in Class-B fixed bias it will be nearly double this. About the RX I know of that ran the output in Class-B is the Super-Pro series and there the tubes were run as triodes.

The dissipation under no signal conditions will be lower for Class-B but the tubes will still run hot. From the voltages in the SX-25 schematic the tubes seem to be run in Class-A or close to it.

Its typical for any power tube, metal or glass, to run much to hot to touch. In fact, most tubes will be too hot to touch.

If the measured voltages are correct the thing is running correctly.

Again, while the coupling caps could increase plate current that would show up in the measured cathode bias value plus it would cause very noticable distortion. I think your RX is working fine.

The RCA tube manual publishes some typical operating specs for 6F6 tubes operating class A in push-pull. With 315 volts on the plate and 285 volts on the screen, and with a cathode bias resistor of 320 ohms, zero signal plate current is 62 ma, and zero signal screen current is 12 ma. That would result in 74 ma cathode current, giving a cathode voltage reading of about 24 ma. Assuming no output, power dissipated by each tube would be 11.5 watts (total of plate and screen power). The 6F6 is rated at 11 watts plate dissipation and 3.75 watts screen power dissipation, for a total of 14.75 watts.

The SX-25 circuit has 280 volts on the plate and 270 volts on the screen. The cathode resistor is 350 ohms and it specifies 18 volts on the cathode. That would mean 51 ma of cathode current. Estimating 10 ma of screen current and 41 ma of plate current, that results in 7.14 watts dissipated by each 6F6 plate, 1.4 watts by each screen, and each filament consuming 4.41 watts for a total power dissipation by each tube of 12.95 watts. That is 26 watts of heat in a confined area. Put a 25 watt light bulb in the sme area and after 10 minutes, try to grab ahold.

73, Colin K7FM

Hi, Gang

I stumbled upon a web posting of the "Index to Surplus."
It is an annotated bibliography of surplus conversion articles
that appeared in CQ, 73, QST, Radio-Electronics and Electronics-World
magazines from 1945 thru 1961.

http://srohrer.com/Radio/Manuals/index-to-surplus.pdf

73,
Ed Knobloch

Oh dear! I think I've hit a bad snag with my AR88D restoration. I was trying to solder a lead back onto one of those trimmer caps (I mean condensers!) under the chassis (in the front box). It is C22 (a 2-12 pf air trimmer, range 3 high end osc). The solder would not take and then after applying an 80 watt iron for some time the cap itself suddenly started to melt! I stopped immediately. Have I destroyed it? Are spares possible to get or can I use another type in this instance of desperation?

Find a place to get 6-12 volts (rectify the filament voltage) and put in a
little LM386 audio amp.
All your heat problems are instantly gone.
Of course you get 1/4 watt of audio instead of 10 watts.......

Oh, one could leave the filaments lit, and hide the little chip away back in
a corner under some wiring harness.
The receiver might last longer in the process !

But his tubes are metal so why light the filament?  Of course, the s/c
solution is sacrilege - no way!  I'd just switch the tubes to 6K6G's -
less heat and a nice glow and change the bias to AB (you don't need
class A P-P Hi-Fi quality!)
Cheers,
Roger

A chap in New Zealand, Charles, has sent me some very good pics of the
MR-9B wiring. Looks like they will be most helpful in sorting out our
unit.
Cheers,
Roger

Hi all

Getting the beast working well. Have now traced many resistors that have
gone high, and apparently I did not fatally damage (see other post) C22 at
all (range 3 still works well though tuning may be a bit out. That's for a
later check). Now there some voltages I can't get right and I'm wondering
if there are any errors in the EMER fault finding tables. For example, V10
(1st AF) had an anode voltage that was much too low and of course that was a
resistor that went high. But on replacng that I now have 60 volts on the
anode and according to the EMER chart it should be 40. I am allowing a +-
20% tolearnce but 50% is too much I feel.

Cheers

No takers on this challenge? Should be simple if I knew enough! Some sort
of saw tooth driven variable frequency oscillator. Not a very wide range
either, say plus or minus 20 Kc/s But must of course be absolutely level
over that range.

Hi, which EMER are you refering to? In my 'original' RCAF manual (
E0 35BB-5GR17-2), dated 26 JAN 55, for the GR-17 (aka AR-88LF) the
first audio (V10) is a 6SJ7 which according to the manual should have
83V on the plate, 34V on G2 and 0V on the cathode. If V10 seems a bit
hot check R39 (100 ohm) from cathode to earth. The values for the
CR-91A are the same but the CR-88 is different, 1.1V for G1, 33V for
G2 and 50V for the plate. Which resistor went high, R40 (270k) or R41
(100k)? .... Ok, just rulled my '88 out of it's case and
checked, I have 81V on the plate. 33V on the screen and 0V on the
cathode with a line voltage of 121V. Not bad for a 65 year old piece
of gear.

Hope this helps.

BTW anyone have an spare RCAF type C5 (10D/6566) power supply they are
willing to part with?

Kevin

Think I have just the circuit for you. It was published in the Eddystone
Users Group newsletter about 7 years ago. Send your real email address
to me at k9ly "at" arrl dot net and I'll send you a PDF of the article.

Thanks very much for the response Kevin! I refer to EMER E773. This shows V10 as a 6SJ7 as you say and with Anode (Plate) at 40V, Screen 30V and cathode0.1V. The cathode resistor is 11% high and therefore OK, but my volts are A 60,and S 37.

Altogether, I have V1 with screen 32% up, and grid resistance 32% high; V6 (6SG7) with cathode volts at .87 (against .5 norm) which is 74%; all resistances at V8 (6H6) too high; and V9 with Anode resistance 503 (33%

low).

I have half a dozen 5T4 pulls, nice power rectifier tubes in metal cans.
Anyone want some?

Is there any mention of the type (therefore input impedance) of the
meter used to originally record the voltages? Just a thought!

I almost retch when I think how many of these must lie in landfills, but
nonetheless...I am restoring a
Hallicrafters S-72 and need a 5-inch, 4-ohm speaker. Not interested in a
permanent magnet type (would like to keep it as "authentic" as I can). No
need of an output transformer either (have one)...just
need the speaker. Minor wear, tear and small rips OK. I can fix those. Will
pay fair price + shipping. Thanks.

Is there any mention of the type (therefore input impedance) of the
meter used to originally record the voltages? Just a thought!

Yes, but the details are in a distant workshop. From memory it was an AVO
model 40, probably 1,000 ohms per volt that was specified. I am measuring
with a very high impedance Fluke! (Probably 11 megohms). Perhaps that's it!
On the other hand the other voltages are all within limit.

Is there any mention of the type (therefore input impedance) of the
meter used to originally record the voltages? Just a thought!

Further to that, Stan, I do have an el cheapo analogue meter so I will try
that. It might very well explain the 'wrong' reading on the V6 grid!

I ran into the same problem on SP-600 and other RX. The
voltage measurements at most places were done with a 1000
Ohm per volt meter and a high resistance electronic meter
will read very high on some of them.

That would do it, yes. Try a Simpson 260.

With a DMM, you will read much higher than an old moving-coil meter when
reading high impedance sources (like plates... the plate resistor is a
very high value quite often).

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=280377222269

This is a large empty steel equipment case with aluminum side & front
panels from a military surplus tube-type power supply trainer. It measures
8" high x 19" wide x 15" deep (including the 3" handles). All panels are
removable with screws. I will include a blank aluminum panel which can be
used as a top or bottom cover. Contact me if you need more photos. The unit
will be sent disassembled to make it easier to pack and ship. I will email
the winner a html file with assembly instructions. Total shipping weight
about 17 lbs.

I am seeking information on a trasmitter called "TR1" which was part of the equipment given to paratroopers operating in northern Italy during WWII.

The "Mission check list" was:

- 2 RBZ receives (which I know well)

- 2 EUREKA radio-localization sets (which I found on an Internet site)

- TR1 transmitters, with batteries, generator, code & cypher plans and crystals.

Would any one be able to give me some information on the TR1, or indicate me a web page where I can find it ? (unsuccessful with Google).

Check for shorts. If it is send me a picture & size and I will go look in
the junk box and see if I have something close for you.

Tony, you may actually be this person!   info@radiomilitari.com  Name:
Antonio.
If not, worth a try?  It's the only address I have over there.
Cheers,
Roger

Thanks Paul. But range 3 (the one affected) seems to work OK. And I have some beehives if I have to do a dirty fix! But, tell me, does your junk box have those tubular trimmers 2-2pf?

Hello --

I've looked a bit for a nice R-390A to go with my National HRO 60 and Hammarlund SP-600. A local audio shop clearing an old warehouse has offered me a combo of a Stewart Warner-built R-390A (Serial Number 27) and TMC (Technical Material Corporation) CV-657A (BuShips) SSB adapter they are clearing from an old warehouse. Both units light up, but I hear only noise

on the headphones -- I can't tune in even local BC stations. Both units
appear to be complete --covers in place, correct knobs -- and in fair to
good cosmetic condition. They also have a EAC R-390A in much worse condition
they might throw in.

I would appreciate any thoughts on their value, and a possible source of
information about the TMC SSB unit. I remember seeing a bit of TMC gear back
in the 50's, but haven't seen any advertisements for them dating after the
60's.

Thanks for any help -- Mitch
(Not a ham, just an old SWL geezer who loves boatanchors.)

These used to be common as dirt on the surplus market. They aren't any
longer. They also aren't much fun to work on.

Contact Chuck Rippel in Chesapeake, VA. He is doing a grand business in refurbishing R-390s, and he'll probably be willing to make a trade for several old units and get you a rebuilt one.

The TMC SSB unit is unavailable and everybody wants one. The last time I saw them for the sale they were in the $500 range.

If you are able to dig into these and repair them, you'll
have one of the *best* SW setups around. IMO its certainly
worth the effort. For SW the R-390 is a better choice, but
the R-390A is still hard to beat.

I've also got a few SP-600's, as well as 51J3 and 51J4's.
The R-390 is better in all respects. SSB converters are in
big demand right now and are worth almost as much as
the R-390A's.

```

The audio on the 390A stinks... the 390 is better but still nothing I would want to listen to strong shortwave stations on. The ringing of the mechanical filters is not pleasant at all. But these things just pull weak signals out of nothing.

I have compared one of the current Watkins-Johnson military surveillance and intercept receivers with the 390A... the user interface on the WJ is a lot better and the spectrum display on it is fabulous, but the 390A is just as good at picking weak signals out of the grass.

I would need a picture and have a go at it in the Garage.  The garage is my
junk box, especially according to my wife :~)

I have old chassis laying around to scrounge from and boxes of unsorted
assorted parts.  It is summer and I could use some time going over some
stuff with the garage doors open.

Send a pix here also- I have a good stock of piston caps- if that is what
you mean by tubular.

Mitch,

Congrats on the new rig. I have an R-390a also. Great Radio I use an old Railway Communications Selective Voltmeter as an SSB converter with a 7360 balanced mixer sounds great.You've probably discovered by now that one of the conversion oscillators in the 390 has stopped oscillating. Mine did that right off and it was the 6ba6 vfo tube.
Your mileage may very.

Good luck!

Tony WA6LZH

> Dale W4OP Yes, that's what I mean! But I can't post pictures to a newsgroup can I? Its definitely C22 2-12 pf that I need, although range 3 is actually working!

I have a new problem and can't understnd the reason for it. The tested voltage between grids of V1, 2 and others to the slider of the RF gain control is meant to be - 1.2v. It was OK. Since I've re-capped and changed a few resistors, it is +.5. Any ideas?

Thanks to those who've responded so far (including direct to my email address) and for the rest of you who've put up with my ramblings.

I now have two more requests for help. 1)   I am missing the outer RF screen (that goes over the RF valves and inner screen containing the variable condenser). No-one seems to have a spare so I must get one fabricated. Can some kind AR88 owner measure up their RF screen accurately so that I can do a drawing for a quote.

Second request: I need the two trimming tools (who doesn't!) I assume no-one here is going to offer me one so I would like to have them made or make them myself. Again could someone measure up for me or even tell me what *they* did to improvise.

Have already taken steps to build a wobbulator and get an old scope so I can emulate those waveforms in the manual.

Perfection then only needs the original S meter as fitted to the AR88 before it became the D or LF... I dare not hope for that but I should think a skillfully made replica might find a good market. The movement is 5 mA, right hand zero, and in the instructions (from the EMER documents, found on the VMACS website) there is a preset pot for adjustment. It should not be hard to make the dial realistically...

This will be the next job after solving the grid bias problem (subject of earlier post).

Thanks and regards

Another ham and I are researching making the extender cards for the FT-101 extender cards. Once designed the information will be turned over to a local club that we are affiliated with (http://www.skyviewradio.net/) for a possible Fund Raising project.

So I can get an idea for pre-ordering parts, finding out if this is doable and if it could actually benefit the club, who would be interested in purchasing from Skyview, a set of FT-101 extender cards? Send me an email here or privately.

The profit from the sales of these boards would be plowed back into the club. Also the profits would be used to used to promote Amateur radio (i.e., JOTA, Kids Day, community publicity event funding, exam books, Radio, Electricity, Electronics Merit Badge training and subsequent Scout ham exams). Or you could choose how your funds may be used (i.e, repeater upgrade, Boy Scout training or community promotions).

It should take us about a month or so to get this completed and ready to ship, I hope.

Thanks in advance for your reply to this forum or to my private email.

Don't you mean Noise Blanker? "Extender" is a Motorola trade name.

JB,
I was unaware of the this use of the word Extender.

I mean Service Extender Boards as in the ones needed to lift a board above
and out of a chassis for electrical testing. The boards in the FT-101 are
inserted into chassis mounted card edge connectors similarly to a modern
computer. So to test the board electrical characteristics and test points
one needs to have physical access enough to employ test probes.

Thanks for pointing this out.

This guy was on C-span Books today. Fascinating concept, It is Semi Fiction. EMP is real, the story is fiction, set 1 second after a nuclear device sends out an electro-magnetic pulse....and the world goes quiet...

New York Times best selling author William R. Forstchen now brings us a story which can be all too terrifyingly real...a story in which one man struggles to save his family and his small North Carolina town after America loses a war, in one second, a war that will send America back to the Dark Ages...A war based upon a weapon, an Electro Magnetic Pulse (EMP). A weapon that may already be in the hands of our enemies.

Months before publication, One Second After has already been cited on the floor of Congress as a book all Americans should read, a book already being discussed in the corridors of the Pentagon as a truly realistic look at a weapon and its awesome power to destroy the entire United States, literally within one second. It is a weapon that the Wall Street Journal warns could shatter America. In the tradition of On the Beach, Fail Safe and Testament, this book, set in a typical American town, is a dire warning of what might be our future...and our end.

Wow my memory must be severely broken, My recollections of the Yaesu FT101
was that it was a tube radio, although I have no recolection below the
chassis.

JB,
It is a hybrid. Three tubes and the rest transistors. One driver tube
(12by7) and two outputs.

There is a ton of information here:
http://www.foxtango.org/ft101/foxtangoft101.htm

Paul

A friend in high school had one. I had an SB102 at the time. Maybe it was
a previous model, but my recollection isn't to great and I thought there
were more tubes. Thanks for the link. SB102 was a hybrid too, but only
because the calibrator and VFO had fets. there like 20 tubes to keep things
warm. I later had a TS830s with the 3 tubes. The hybrid radios with the 3
tubes were the very best of both worlds.

Hi, Gang

I posted some 73 Magazine articles on A.M. linears
for the Heath Sixer and Twoer by K1CLL,
(using type 815 or 2C39 tubes) and another
article on doubling the power of the Sixer
by changing the final tube from a 6CL6 to a 7558:

http://rapidshare.com/files/262605207/Low_Cost_Linears_for_the_Twoer_K1CLL.pdf

http://rapidshare.com/files/262605206/2C39_Twoer_Linear_K1CLL.pdf

I hear hams talking about the Kenwood TS-830S "GOLD LABEL". like it is
something special...My question is : What does the gold label mean?
For several years I worked as service manager for a Kenwood
dealer,attended the Kenwood service seminars ,received all Kenwood
bulletins etc...Never have I ever heard Kenwood refer to or advertise
a gold label edition of the 830..Can someone tell me the true,factual
story on the gold label ..TNX  W4PQW

Yes, there was some model like that. I remember one of the local guys
yammering about it every time he was given the chance.

I don't know if there was anything to the label other than "being known
as owning the special edition version" much like car manufacturers tack
on special escutcheons in various markets.

Hi Harold,
Here's some chatter I found on an eHam forum- it appears that it's all about
nothing:
Dale W4OP

      Kenwood TS 830s VS Kenwood TS 830s Gold Edition?  Reply
      by KB2CWN on January 24, 2001  Mail this to a friend!
      Can anyone tell me the difference between the 830s and 830s gold,
besides the gold logo under the VFO dial? Thank You..

      RE: Kenwood TS 830s VS Kenwood TS 830s Gold Editio  Reply
      by N5NJ on January 26, 2001  Mail this to a friend!
      The original 830 had a simple silver and black sign under the main
tuning knob. Later in it's life, it changed to the so-called "Gold Edition".
I don't believe that Kenwood marketed it that way, nor is there any
significant difference.

Better start stock-piling all those old tube rigs ready for the Big One,
then! As long as there's a ham with an old HRO, ARC-5 or TBS-50 in each town
then you'll still have a sort of comms.

A few years ago when I decided I wanted an '830S I did
some research and discovered there is no difference.
Apparently early production had a silver emblem, later
had the gold label. The majority had the gold label from
what I've seen. And yes, I finally got one and love it!

Forgot to add that advertising a TS-830S as a "rare gold label"
version is much like a used car salesman saying a car had high
compression hubcaps and 4-speed windshield washers.
Someone is bound to belive him!   ;-)

Gold Label was the last and final model and incorporated all updates and
fixes for the line. I think it also had all the filters (a big expense).
There were some improvements made to the power supply, receiver performance
and VFO stability. I don't know of other specifics of the Gold.

Hi, Tim

Sorry, I used Rapidshare because I am already
a member there. I thought free users only have to wait 15 min
between downloads, not limited to one download per day as you say.
(You may need to refresh your browser after attempting
the second Rapidshare download, in order to see the "count down" clock.)

To work around this problem, I have now combined the articles
into one large zip file, for ease of download:
http://rapidshare.com/files/263361625/Sixer_and_Twoer_amplifiers.zip

I didn't combine the files in my first posting because most people feel safer downloading pdf files rather than zip files.

73,
Ed

I use a rapidshare downloader FireFox add on. I just stick the links in
the "queue" and eventually they magicaly appear on my computer. Even with the
delays between files, I get an average download speed of over 60k bytes per
second, which for here is pretty good.

I am NOT a member.

Geoff.

Source: http://www.k4eaa.com/faq.htm
What is the difference between a TS-830S and a TS-830S "Gold Edition" or "Gold Label?"

At some point Kenwood introduced the "Gold" version of the 830S. It came from the factory with all four filters installed, 2 for CW and 2 for SSB. The 830S had a VBT control, which required overlapping of the 2 sets of filters, by varying the heterodyne frequencies, to achieve a variable bandpass. The standard 830S had only the 2 SSB filters factory installed, with the CW filters optional. The VBT with the standard filters varied the bandpass from about 800Hz to 2.4KHz. Adding either CW filter will allow a 500Hz CW bandwidth, but the inclusion of BOTH filters allowed the VBT to adjust from 0 to 500Hz BW - A very nice improvement. The "Gold" series came with all 4 filters installed. Be advised that many Gold 830S's today have had their CW filters removed and sold separately..

UPDATE: I continue to occasionally hear from people that dispute the Gold/Full-Filter statement. After looking at over 100 TS-830S's I still have yet to find a Gold that didn't either have the filters installed, or show positive signs of filter removal. This issue will probably remain in limbo, however, until someone finds a brochure or sales flyer touting this "Full Boat" transceiver. People have seen them, bought 830's as a consequence, but no one has any real proof.

BREAKING NEWS: Joe Kenwood called me yesterday from Tokyo Japan, and confirmed that "Golds" were delivered with all 4 filters factory installed. This should put to rest any controversy, and prove my point once and for all!   Thanks, Joe! 8^D

Hi All,
Just a lurker here, really and would like to maybe expand on the recent discussion about FS and WTB type posts a bit.

I have visited this group on and off for a few years and not participated mostly due to having little of substance to contribute. I used to have a bunch of BA gear, but time and space have kept me from doing anything with any of the stuff I do still have. As such, I found my way back here looking to maybe divest myself of most of the stuff that I still have. I love this old stuff, but realize that I just won't likely have the time or space to ever do much with most of it. I bothers me to have it sit unused here when there are likely folks who would use and appreciate the stuff. Much of it has gone unused for years now, and I realize that it is not likely to get used any time soon.

The primary reason I would think to post FS stuff here is that this seems to be one place that would attract folks who are interested in what I have. Nothing more.

In an honest effort to not be "That guy" who arrives here to sell a bunch of stuff with little else to offer, any suggestions as to where one could most readily sell some of this? I'm not looking to get rich here, just get a few bucks for the stuff that may be worth something to someone. I'm pretty much sick of ebay, and it seems to offer less and less value and more and more hassle these days, unless you are some sort of volume seller. I have no interest in that.

So please don't chew me up, I'm not whining, just curious. Any suggestions as to what would be an appropriate and effective venue?
Thanks,

-Al

Joe Kenwood eh? From the horse's mouth. Very impressive. Now I would like
to hear from the designer of the RCA AR88, but as that was in 1939 and his
minimum age at design time cannot have been < 20 that would make him
(scratches head and reaches for calculator) 90. Not too bad, I suppose..

I've always wondered why Trio chose that name. Kenwood, which by then was a very popular food mixer Europe got their name because the inventor of the device/owner of the company was named Kenneth Wood. I wonder if they just took the name because it sounded good, or there was some other reason.

Geoff.

Good luck Al. My own instinct would be to post it once. There is a frequent poster here who continually peddles stuff and I got so irritated that I simply blocked him. Others may have too.

You may get flamed for it, but the briefer the better with perhaps a veiled reference to your email address for fuurther details. Maybe a one liner like 'FS: Boatanchor gear including lightweight version of AR88 Joe at bloggs dot comm'?

An excellent place to post things for sale is QTH.com.
It is free, and there are sub-areas where you can list things.

I'd agree with that, QTH.net has lots of categories for different
equipments, makers, etc so you can target the right people for your sales.
I've frequently bought stuff in from the US via QTH, without problems.

At the Kenwood seminars the spokesman always mentioned that the name
KENWOOD was chosen because it is a name that is common in Japanese and
English language..W4PQW

NEWS RELEASE; released for Immediate Publication
Largo Florida-

The free radio book website (www.freeradiobook.org) is about getting you the information you need. You do not need to spend a lot of money to enjoy a radio hobby. There are many reasons people choose a radio hobby. There are many things you can do with a radio hobby, including to help you enjoy the hobbies you already have.

BOOK 1 is about all the radio hobbies, the people that use radio, and their reasons for using radio as a hobby=85.
Titled   "Sharing the World with Our Children- Sharing the World with Our Friends"
Includes- *Radio and Electronics Hobbyists: The Common Ground * Culture from your Radio *
*A Hobby for a Hobby Like Yours... * RADIO TONIGHT * Technology and People- not Technology or People * Back Home Radio*
Written by a father that got closer to his kids by using radio.
Written by a citizen that got closer to his neighbors by using radio.
Written by a man that learned more about the world, and the people on it by using radio.

BOOK 2 is a project paper titled =93Solar Power Project 2009=94 and is about using solar power to operate a portable communications unit.

BOOK 3 is for radio users that are not hams, such as a Law Enforcement Officers, Firefighters, Government workers, and people who used a radio in the military. They can download a guide to translate what they already know about radio into the historic and fraternal language of amateur radio.

BOOK 4 is about how to choose WHICH radio to buy. Once you decide that you want a radio
for your radio hobby, this book will help you decide what is important in buying the first new radio. It=92s also great for hams returning to the hobby. Written by the National Association for Amateur Radio, it applies to almost any radio, and any equipment in any sub-hobby that involves radio.

Thanks for the input, guys. I do appreciate it.
It sounds like QTH.net is the first place to try.
Maybe get a few things posted there this weekend.

Thanks again for taking the time to reply.
Regards,

Al

I knew a guy who wanted me to fix up an old S-40 for him to prepare for such a day. I asked him how he was going to run it. He said a vibrator inverter would convert a storage battery to 120 volts. I asked him how he was going to charge the storage battery. He said solar panels. I then mentioned that since solar panels were semiconductor junctions, they would all fail when the radios failed.

I think the hand crank would be the option. But, you can only crank so long until you tire out. The military hand crank systems are so tiring to operate that someone has to be shooting at the cranker before he cranks.

73, Colin K7FM

NEWS RELEASE; released for Immediate Publication
Largo Florida-

The free radio book website (www.freeradiobook.org) is about getting you the information you need. You do not need to spend a lot of money to enjoy a radio hobby. There are many reasons people choose a radio hobby. There are many things you can do with a radio hobby, including to help you enjoy the hobbies you already have.

BOOK 1 is about all the radio hobbies, the people that use radio, and their reasons for using radio as a hobby�.
Titled   "Sharing the World with Our Children- Sharing the World with Our Friends"
Includes- *Radio and Electronics Hobbyists: The Common Ground *
Culture from your Radio *
*A Hobby for a Hobby Like Yours... * RADIO TONIGHT * Technology and People- not Technology or People * Back Home Radio*
Written by a father that got closer to his kids by using radio.
Written by a citizen that got closer to his neighbors by using radio.
Written by a man that learned more about the world, and the people on it by using radio.

BOOK 2 is a project paper titled �Solar Power Project 2009� and is about using solar power to operate a portable communications unit.

BOOK 3 is for radio users that are not hams, such as a Law Enforcement Officers, Firefighters, Government workers, and people who used a radio in the military. They can download a guide to translate what they already know about radio into the historic and fraternal language of amateur radio.

BOOK 4 is about how to choose WHICH radio to buy. Once you decide that you want a radio
for your radio hobby, this book will help you decide what is important in buying the first new radio. It�s also great for hams returning to the hobby. Written by the National Association for Amateur Radio, it applies to almost any radio, and any equipment in any sub-hobby that involves radio.

Should work fine. A better solution is a steam engine that runs on any
fuel, including grain alcohol. If there is no one on the radio, you can
drink the stuff.

Looking to buy up to five (5) knobs for a Hallicrafters S-72
restoration project.

The knobs are maroon/brown in color and made of molded
plastic. They are 0.915-inch in diameter and 0.455-inch thick.
The front of the knob is slightly rounded. Viewing the rear
there are four 90-degree extruded "compartments" plus a
serrated shaft hole. 16 finger grip serrations surround its
edge.

I have posted a photo of the knob at this web address:

http://img.villagephotos.com/p/2009-8/1344456/S72_KNOB.jpg

The knob may have been used on some of the Hallicrafters TVs
but the S-72 and S-72L is the only model radio I have found this knob
used on. Of course, similar versions may have been used on other
brands as this was a pretty popular knob in consumer electronics
in the late 40s and 1950s.

Thanks to anyone who can help.

If stages are often peaked. For ham use, it should be acceptable. One particular problem may be that am stations will not have full bandwidth, so the audio may be restricted a bit. If you are careful, you can emulate the sweep generator by setting the generaator above, on and below the if frequency. The total bandwidth should be the desired wide bandwidth. Then, adjust the transformers so that signal level is about the same on all three frequencies.

A few years ago, I acquired a spectrum analyzer with tracking generator. Now, alignment of any filters or if stages are so easy that I feel guilty.

I also recall using a BC-221 as a manual sweep generator.

the improtant thing is that you will come close with the old "peak each stage" approach. Make sure you do not overload and follow the other instructions. I have aligned more than one receiver by ear, when I had nothing else. Generally, close is good enough.

Also, make sure you use the proper alignment tools. I have worked on a lot of receivers butchered by improper alignment tools.

73, Colin K7FM

Vere, ita est. Quaerit, "vivit". "Vivitque" appropriatior est.

Et Extra et pedans sum.

Luck may be running out!  This radio has a fully integrated remote
control unit - band switch (to motor on radio chassis), MVC, AVC, CW,
phone jacks and volume, as well as the mechanical tuning drive (which
works), so the radio won't work without it (or a full emulation.) Our
remote unit is in very bad shape - I'll have to rewire a lot of it. By
any chance, does anyone have a spare Bendix type MR9B remote control
unit?
```

Cheers,
Roger

Now that I've replaced a defective cap inside an IF can,
the radio is fairly hot on most frequencies. However,
the published alignment procedure leaves the low end of
the standard broadcast band somewhat weak.

Any ideas or revised alignment procedure for the S-76?

The S-76 does not appear to have any sort of padder for the RF on the lower two bands. Probably the RF transformers were adjusted at the factory by moving turns on the secondaries. Look at these and see if you can spot anything. You can sort of test this by adjusting the HF trimmers to see if you can get a stronger signal on the low end. Its not surprizing that the transformers may have changed a bit with so much time.

Colin,
  Thanks for the suggestions. I agree the the peaking method should be
okay. I will keep my eyes out of a used sweep gen and upcoming swaps.
I have a good set of alignment tools so I can align without causing
damage. Mike KF6KXG

Summary: Free for shippin
Keywords: meter faceplate, swr sensor
User-Agent: nn/6.7.3
Xref: g2news2.google.com rec.radio.amateur.homebrew:2933 rec.radio.amateur.antenna:13178 rec.radio.amateur.boatanchors:3138

Crossposted to rec.radio.amateur.homebrew, rec.radio.amateur.antenna, and rec.radio.amateur.boatanchors

I wanted a dual-meter voltmeter to mount atop an LDG battery booster to continuously indicate input and output voltages, so I rebuilt an old SWAN Electronics SWR-1A meter and now have the faceplate and the internal SWR sensor unit left over.

I'll mail (without charge in the USA) the faceplate to the first person who wants to restore hizer scratched-up SWR-1A faceplate.

Although it weighs less than five ounces, the sensor unit is obviously a bit bulkier (about 5" x 2" x 1.5") than the flat faceplate!-) It includes two integrally-mounted SO-239 connectors, two diodes, two resistors, two capacitors, the dual pot and its knob, and the really-sturdy sensor (but NOT the two 100 microamp meters which I used in my project!-), all connected as they were in the original unit. If someone wants it, it should mail well and shouldn't take too much postage.

```

So fasr so good.

>-- removed bearing end plates, bearing grease looked a bit congealed,
>added some "electric motor" oil to thin it a bit

You want to scrape it out and put new grease in there if you can, if only
because modern grease is a lot more stable and will make the bearings last
longer than the original stuff.

>-- commutator and brushes in perfect shape - factory new, of course
>(there are several new brushes in small metal cans actually stored in

Hi all

I posted before on the subject of carcinogenic oil in the tub capacitors and why retubbing was not an option.

To cut a long story short, removal of leaking tubs has left drip marks on the AR88 chassis. They will not come off with any normal solvent so are now suspected of being some other substance than PCBs.

So those retubbers *may* not have to be so depressed!

Meanwhile, I'm playing safe and not retubbing.

FS: My very nice, good working Hickok 539B tube tester. The case is in very good condition and solid, better than most. Control panel is near perfect. Scroll chart is nice and bright works smoothly. Photos on request. This is Hickok's best tube tester. It is very accurate. I want $650 and plus shipping. Copy of manual, cables, and tube pin straightner included. Thanks, Charlie Hugg, K5MBX

FS: Nice HP 410B VTVM. It is a nice unit and goes well with servicing the older radio's. It includes the RF Probe and other cables plus a copy of the manual. Price is $155 plus shipping. This meter looks brand new. It is the cleanest one that I have seen in awhile. It works great. Thanks, Charlie Hugg, K5MBX

Hi,

Does anyone have a type MR-9B Bendix Remote Control Unit for a Bendix RA 10DB WW2 aircraft receiver (circa 1942-44) for sale? I'm restoring both units as a volunteer for the Canadian Air & Space Museum, Toronto - Lancaster bomber restoration project, see http://casmuseum.org/about.shtml

If you don't want to part with it, I could use some good macro pictures of the wiring as the MR-9B unit we have was butchered sometime in the last 60 years and I'm trying to rewire the pots and band switch. I have the schematic so making some progress but a spare unit or some pics would help. As many of you know, the RA-10DB receiver and the MR-9B remote are totally integrated so the Rx can't be operated stand-alone. I suppose I could build a complete remote unit emulator but I'd rather not! Besides, it won't look right.

BTW, we also have to rebuild the cables. Does anyone have the right Canon plugs? Present plan is to emulate with separate female pin connectors to the Remote Unit and Rx sockets, two short stubs of multiway wire and two pairs of modern multiway plugs and sockets. Any better ideas?

Thanks for all replies,

Cheers,

Roger

PS. Of course, post replies but email any pics to me at "analogdino at (ta-boy) rogers dot(ty-as-they) com(e)", suitably decoded. Visible address is fake for anti-spam. Thanks again.

How often and how recently have you posted about boatanchors here?

This was set up as a discussion newsgroup, with a lot of debate over whether ads should be allowed. It was 1995, and even then there was worry that some sites would not carry the newsgroup once it was created if it carried ads. The ads won out, but it was never intended as a buy and sell newsgroup, it was meant as a discussion newsgroup where the people who wanted it felt the buying and selling was an integral part of it.

Most of those people who felt that way are long gone, or never even participated.

Hence there really is very little discussion here.

YOu should take that as a hint. If there's no discussion here, then why in the world would you think it's a viable place to sell things? if nobody is reading the newsgroup, because there isn't any on-topic discussion, then why would placing an ad here be more viable than in the real buy and sell newsgroup, rec.radio.swap? Or a local buy and sell newsgroup, that may not have many interested in old radios but would have locals that you wouldn't have to ship to?

Or Ebay, that is set up for buying and selling, and surely reaches a lot more people than those who still read this newsgroup. On the other hand, anyone still reading this newsgroup undoubtedly aware of ebay.

If you want to sell something, then at least do your part to lure people here by participating in the discussion of old amateur radio equipment (not computers, not audio, not guns, not 1970's solid state ham gear, and certainly not anything more recent than the seventies). Because if you don't do it, you'll merely be trying to leech off the discussion, with the joke being that there isn't enough discussion to lure people here to see your ads.

Michael is right in his rememberances of the start of this group. I was the proponent who started
it. Then I was KT2Q.
I also believe the equipment newsgroup was to be discussions of ham gear, not selling, but that's about all there is in that group.
rec.radio.swap - I dont even check it anymore, since as I remember all it is is ebay ads. Promotions to get people to go check their ebay ads. How boring.

You gort a boaanchor to list? I say go ahead and list it. It's better than nothing!!

I believe from his original post, he wanted to buy something, not sell something.

This groups will have a charter somewhere that states the policy on advertising set down when it was created. I searched but could not find the charter but someone else with more time probably can.

In general Usenet groups frown on advertising but some advertising is permissible or even encouraged, especially where it is helpful to the community using the newsgroup.

I am not a long time user of this group and can't pretend to know what its policies are but I do see some advertising here. I should think that WTB is allowable especially if someone is looking for parts for something. I've done that myself and had considerable help.

A good source of information about Usenet can be found at:

http://www.harley.com/usenet/

This also has links to other sites with even more information.

A Google search will find even more.

Off topic but who cares :-)
Rick, It's been a long time since we worked in the same building.
Now ON topic
I still check here and occasionally see something of interest. But I am
not as active on ham radio
as I used to be

Cheers
Bill K7NOM

Well, it certainly won't be about guns, that's for sure! A posting I placed
here many years ago about antique radios managed to start a few US
'enthusiasts' boasting about how they'd shoot anyone they didn't agree
with...

Ok then, here goes...

WTB any spares for the venerable AR88, preferably but not necessarily in Australia.

A perfectly legit request IMO.
The curious thing is that there seem to be more AR-88s
and related models in Europe than in the USA.

Cheers,
Roger

Not specific help but a place to look. In about the late 1940's the publisher of CQ magazine published a series of paperback surplus handbooks on converting surplus radio gear. These had schematics and details of many fairly common equipments. Its even possible that some public libraries may have them.

Yes, I believe they were exported to Europe and UK in large numbers as a
specific part of the war assistance effort.

I'm working on a Hallicrafters SX-25 Super Defiant. It uses two 6F6 tubes in push pull in the audio circuit. Boy do they get hot! Too hot to touch. If my finger lingers I'd have an awful blister in less than a second. Is this normal? I've checked the tube voltages and they seem to be where they should be...280 VDC on plate, 6 volts on heater, 18 volts on cathode. Does anyone have any ideas about how to help these things run cooler?

Steve

Steve,
Check the control grid voltages to make sure the bias is right. Sometimes a
leaky capacitor from the previous stage's plate will turn on the following
stage hard. Besides overheating the tubes, this can also burn out the power
transformer. If you haven't replaced all the electrolytic and paper
capacitors, I would suggest you do so before proceeding further.
Regards,
Bob AD3K

I my early ham radio days I had a model 15 and a model 28. I always dreamt of having a model 26, but I have never seen one in reality, just on the books..

Pity is that Gloucester is some 3500 miles away from where I live, otherwise you would see me knocking at your door.

The trick is to find someone in the are who is being transfered to Rome and their company is shipping a container of houshold goods for them. Since the price is by container, and not by weight, it is often cheaper to ship a container that is not full than to do it by "lift van" (a custom made wooden crate).

In years past people wouldstuff their containers with household goods that they could not get outside the US, such as toilet paper, disposable diapers, canned tuna, however I think those days are long gone.

If you ask around, you might find someone who is willing to accomodate you.

Geoff.

While I agee with Bob Spooner that you should check the grid voltage (should be at ground potential) my experience with 6F6 and other metal power tubes is that they run very hot and its pretty much normal for them to be hotter than you can touch.

If the grid coupling caps are leaky they will put some positive volage on the grid. This will make the tube run hot but will also usually produce very noticable distortion. Use a very high impedance meter to make this measurement.

Again, hot power tubes are normal.

Thanks for info, but finding someone close to the present owner and willing to ship a container to Rome may not be that easy.

Anyway I will try... who knows.

If the quiescent cathode voltage is good, you can rule out a bias problem
although it might be worth replacing the coupling cap pre-emptively.  The
heat tends to bake 'em.

About all you can do is remove the 6F6 and put in a tube with a higher
dissipation rating.

If the cathode resistor is the correct value, and the voltage across it is correct, then the power drawn by the tube is correct. The tubes are running Class A and so over half of the power consumed is dissipated by the tubes (divide by 2 of course). You can increase the cathode resistance or increase the screen resistor, to reduce power. This could cause a mismatch in the output transformer ratio, but being Class A, it should still sound fine.

Generally, what I would expect you would be seeing (actually, feeling) is a combination of small factors. The filament voltage is probably above 6.5 and the plate and screen voltage may be a little above specified. This is because we have a higher line voltage. Often, you have to think about incremental improvement, rather than night and day. If you drop the filament voltage about .5 volts, you will decrease heat from the tubes by 1 watt.

Also, adding a small muffin fan can do wonders to remove heat from those old metl boxes.

73, Colin K7FM

I "tube roll" various 6K6's, 6F6's and 6V6's through vintage radios
(checking the bias, of course, but not 6L6's - too big!) and they all
run very hot - far too hot to touch!  The metal ones seem worse for
burns.
But, -18 volts seems a bit high for a class AB P-P stage bias... no
need for class A.  There might be a positive g1 - you should check
that the audio coupling cap from the previous stage is good.  It
should permit no more than, say, +5 mV on the o/p tube g1.
```

Regardless, I always change this cap for a modern, high voltage, 0.05 uF.
Cheers,
Roger

I'll agree with both the previous posters - check the caps on the control grids of the 6F6s. BUT that having been said, as I remember it the 6F6s in my old SX-25 got hot enough I could keep my coffee cup warm on them. Those old metal beam power pentodes like the 6F6 and 6L6 would burn your finger very quickly.

I do not remember the company for sure (possibly Millen?) but back in the 50s and 60s a company made slide-on heat dissipators for the metal shell octal tubes. I had a piar of them installed on the 6F6s in my old SX-25. Touch base with any "old timers" you know and see if they have a couple of them stashed in their junk box.

Best Regards,

Bill Bowen
Sacramento, CA

they used them in all the best listening centers.
I had one for 10 years it cost me �10
apparently it came from Bletchley.
It was way to big to move round my small shack, so I gave it the local club.
I hear it went in the yearly auction for,,,
 you guessed it �10

Thanks Richard

But not only does it smell bad, it is positively dangerous! Believed to be PCB oil which is carcinogenic. (BTW, they are not electrolytic but oil filled paper caps). I have received comprehensive advice on disposing of the leaky capacitors (should I say condensers?) safely and in accordance with health regulations. They MUST not be just thrown into the gargbage. I will be removing mine according to that advice. Either I will obtain genuine replacements or I will have to do with tagstrips and indivdual caps. Ouch! I know that's sacrilege but its the lesser of the two evils if new 'originals' can't be found --- and by the way I may have found them!

I was refering to bathtub electrolytics and electrical "leakage". If these are oil-filled paper they may well contain PCBs. I don't know how one disposes of these in Oz land but the oil is carcinogenic. This is one reason high voltage transmitting capacitors are hard to find surplus.

Modern plastic caps are far better than the originals. If you can find suitable terminal boards you can mount them so that they will not look out of place. Oil filled paper caps were considered to be high performance and long lived at the time. Of course, these are probably sixty years old so that really is long lived. If the impregnant has leaked out, even partially, the caps have probably changed in characteristics and should go anyway.

Sorry Richard. Did not mean to alarm you. In fact there has been some doubt about whether the material in the AR88 caps is PCB and indeed there's even some controversy about how dangerous PCB is. But I personally (nervous fellow that I am) prefer to play safe. I even have cards all over my workbench reminding me that there are lethal voltages in an AR88. Trouble with modern electronics is we get used to handling 5volts with impunity and it is as well to rekindle the caution we used to apply (or should have) in the valve days. For those who want to read up on PCBs try the writings of Barry Ornitz who is a very knowledgeable chemical engineer.

OK Richard

I was typing my reply when your message arrived. AFAIK there are no electrolytic caps in an AR88. The bathtubs have groups of 3 of varying (but the same per tub) capacities, some 0.1, some 0.25 etc.

```
Even the main smoothing caps are paper. They are 4 mfd.

There seems to be a nostalgic uprising of AM interest. Me: I'm trying to
kindle an interest in Top Band (160 metres) AM in my area. Will then
probably build again per the RSGB handbook 1965ish. 10 watts max output (I
seem to remember) per rules at the time

Well, I'm not very alarmed:-) PCB's are considered serious environmental polutants and are toxic, especially when exposure is chronic. The may be carcinogens but when I looked this up just a few minutes ago, it does not seem to be well established, I had thought it was. If you have to clean it up wear _nitrile_ gloves since the stuff will penetrate latex. There is certainly no reason to replace intact PCB filled capacitors if they are not leaking and are OK electrically.

PCBs began to be used to replace mineral oil in capacitors and transformers in the 1930s because they are not inflamible and have better electrical characteristics. They were sold under many trade names but its possible some other substances may also have been marketed under those names. In capacitors and transformers such names as Askarel, Pyranol (General Electic), Dykanol (Cornel Dublier), and many others.

Spot on with the nitrile gloves, Richard, as advised by Barry the chemical engineer. I bought some this morning. Two of my bathtubs are leaking oil badly and they will have to go. Per advice they will go in a sealed marked container to the council hazardous waste collection.

I certainly won't be doing a repot job! Either I'll obtain the replacements I think I've found, or in the interests of safety I'll put up with a non standard change and mount individual caps on tag strips. If it turns out they must be screened then I'll fabricate new tubs.

Man, I'm real sorry, but I junked one last year. Storage unit was plugged,
something
had to go.

Good morning Harold,

There is an excellent net on 75 meters in central Wisconsin on Saturday mornings at about 9 am central time. It usually starts right after the Midwest Classic Radio Net which in on 3885. This net is the Vintage SSB Net and it is on 3840.

They also have an excellent website which is: http://www.vintagessb.net/=
.

I acquired a GT550 along with its matching power supply about 10 years ago from someone's garage. I've had the thing packed up for about the same amount of time. I have the manual and tons of schematics along with several hand drawn schematics from the previous owner(s) with various notes and dates. I pulled it out over field day and turned it on to listen to it next to the Alinco HF rig that hasn't been out in at least 9 years to see if it still could hear. Surprisingly both rigs worked and my oldest son, now 10 seems somewhat interested in the hobby. Maybe he just likes all the dials and lights. :-) So, I'm thinking I want to dig into this vintage radio and try to get it back up to snuff as an electronics project for my oldest and I. Does anyone have any hints and possibly and specific vendors that they've had good luck with in the aid of restoring a vintage radio? Thanks in advance and 73 de KE4RGH.

Hi. I remember the GT550; we had one at our high school ham club around 1975. It's nice that your son is showing some interest in the hobby. Hopefully he'll be bitten by the bug.

Regarding your question, I think the answer depends on whether you're looking for vendors to provide repair services, or to provide parts. There are lots of parts vendors around. Digi-Key and Mouser are perhaps the two biggest general-purpose electronic part suppliers who still deal with small orders. They carry lots of resistors, capacitors, semiconductors, and other general purpose items.

If you need parts that are specific to the GT550, you can post a message here or at other ham-oriented sites like eHam or QRZ.com. Likewise if you want to post technical questions as you try to repair the GT550 on your own.

If you're looking for someone to ship the radio off to for repair, I've heard of a few guys that offer repair service but I don't have any links to offer you. Maybe someone else can assist.

73 & GL,
Joe K9LY

I have a RME DB-20 RF pre-amp that needs a schematic for me to check against. This unit was made around 1938 and uses steel tubes. They were very popular during the war because they isolated the oscillators from putting anything back into the antenna for the enemy to zero in on. Mine is just for short wave listening and I have no continuity on the ground side of the antenna. If anyone can e-mail me a gif or pdf of the

schematic I would be forever grateful.
Thanks much,
Bill Baka

P.S. These had 3 tuned stages and 2 tubes worth of amplification so they
were pretty good for their time. I only get about 10-15 dB now but it
still helps.

There are schematics at BAMA http://bama.sbc.edu/
A Google search found lots of hits.

Thanks all too much. I just printed them and found that one set is
better than the other so I have a good, readable schematic to refer to.
Now to find the soldering iron.
Cheers,
Bill Baka, happy now.

FS: Rarely used three hole ETO Alpha 78 HF Amplifier. Has broadband mode for fast frequency changing without tuning. One of the later Alpha 78s with the good paint. Excellent condition, no damage, no dings, no scratches. This amp has been gone over by an local Alpha Amp technician. Actually I purchased it from him after I asked him to keep an eye out for a 78 that looked and worked like new. This one is perfect. It had one scratch in the top of the cabinet and he had the cabinet repainted by a professional in the same color as the front panel. He also did the Low Drive mod. The tubes are the original ones and have a full 1500 watts. This really is an almost brand new Alpha 78. Price is $2575 plus shipping. Thanks, Charlie Hugg, K5MBX

FS: Very rare R.L. Drake TR-6 6 meter transceiver with NB-9 Noise Blanker
and MS-4 speaker and AC-4 power supply. Also included is the rare Drake
CC-1, SC-2, CPS-1, and the TC-2 2 meter transmitter with a set of spare
tubes. The station works great. All of this equipment was completely gone
through, aligned, and checked out in November 2003 by Jeff Covelli (WA8SAJ)
and seldom used afterwards. Serial number of the TR-6 is 478. Comes with
original manuals for the SC-2 and TC-2 and a nice copy for the TR-6.
Physical condition for all units is very good. All cables included as is the
documentation of the work performed by Jeff. Price is $1475 plus shipping.
Digital pictures available. Thanks, Charlie Hugg, K5MBX

FS:Heathkit SB-221 KW amp professionally modified for 6 Meters. This is the full modification including removing the bandswitch and the standard RF components and rebuilding with components designed for 6 meter. It has graphite 3-500Z tubes, new rectifier board, new multimeter, and new High Speed Fan. This one is in exceptional nice cosmetic condition and it works great. 90 watts in will produce 900 watts PEP out. Price is $925 plus shipping. Thanks, Charlie Hugg, K5MBX

FS: Drake MN-2700 Antenna Tuner capable of handling 2000 watts PEP. It covers all ham bands from 160 to 10 meters, including the WARC bands. It has a very accurate built-in SWR and Power Meter. It works great. This is an early production unit and has the gummy paint on the cabinet. The cabinet is in good condition, but would look better if stripped and repainted. The front panel is excellent. I am the second owner of this antenna tuner. This unit comes with the original Drake Instruction Manual and the original

letter from Drake to the customer and the Quality Control Record Tag with
the Serial Number of the unit and the date Oct 29, 1979. Price is $285 plus
shipping. Thanks, Charlie Hugg, K5MBX

You will want to replace all the electrolytics in the rear apron mounted audio board.
If you can find the xtal calibrator, it is a nice addition.
One of the flaws in this rig (and the SBE SB-34, and likely many other BA xcvrs) is they have one adjustment that is to equalize the VFO for RX and TX. This can only be done on one freq- above and below, there will be an increasing delta between the two- w/o an RIT, this is problematical.
The 2 planetary drives in series always seem to develop backlash over time- keep them lubricated and reduce friction along the drive train as much as possible.
Wonderful looking rigs though.

Dale W4OP

I've come into possession of a Bruel & Kjaer Type 2400 VHF converter; it appears to have an input connector that takes a car radio plug, an SO-239 output connector, and cover 10 MHz to somewhere about 300 MHz. Nice planetary drive, with two concentric knobs, for tuning; other controls for band switching, oscillator level, and meter type (Off, 2300, 2400), but no meter or provision for one. It's not virgin: there's been some hacking, but I can't tell exactly what without schematics. I can't find anything about it through Google; anyone here ever seen one?

The input connector does not take a car radio plug; it is a proprietary
B&K connector.  This device is normally used with an ultrasonic
accelerometer and a sound level meter or spectrum analyzer to measure
VHF frequencies by heterodyning them down into the audible
range and filtering them.

B&K has no docs on older products as far as I can tell, but Gunther
Rassmussen of GRAS Instruments may.

In addition:

Replace any waxed/paper caps (typically used in coupling of stages, cathode bypass, etc). And check all the carbon composition resistors for tolerance. They tend to drift higher. If you replace any resistors use a non inductive resistor (carbon compositions) in circuits above....say...18mhz or less. Mica and ceramic caps should be OK. They age well over time.

See these pages of my experiences for some possible tips from different gear.

Thanks very much, Scott. That's good to know, but Googling produces only
three partial references for GRAS Instruments, apparently in Quincy, MA.
Can anyone provide contact data for Mr. Rasmussen or for GRAS Instruments?

Hi,
I've never worked on a GT550 but I've done three of the Galaxy V models which I think are somewhat similar in many respects. The main gotcha that I encountered was a bad output bandswitch on 2 of the 3. Its a rather under-rated looking rotary switch and not impossible to find a replacement for.
Don't know if the GT550 uses the same switch but I thought I'd mention it.

I love the silky tuning and the way the dial is backlit on the Galaxy V models! I had the hots for the 550 when I started hamming.

Oh, on the dual vernier drives if they are goofed up...I've heard of guys prying them open for cleaning. I've never had to, though. Sometimes just an extra little crimping tighter helps a worn one. At any rate, you can find them easily enough if you need to replace them.

Good luck with it!

-Bill

Ordinary film resistors, either carbon film or metal film, will work fine. The inductance is not significant unless the value is below 100 ohms. Above this value,
shunt capacitance dominates the impedance. A ten ohm resistor starts becoming inductive around 20 MHz and a 1 ohm resistor starts becoming inductive over 1 MHz. If your email works, I'll send you some graphs.

Barry,
```

Graphs would be good. Graphs would be much appreciated.

I have been on many manufacture's web sites looking for their published tests. I even emailed Ohmite about their OX line and received a polite reply about their test tech using their impedance bridge and what he/she found. But they could (would?) not supply and published data. So I must take it on their word.
http://www.ohmite.com/cgi-bin/showpage.cgi?product=ox_oy_series

I have brought this discussion to other newsgroups to receive comments and opinions devoid of hard data. Not that I am complaining. I cant seem to easily put my finger on any myself.

I realize that even carbon comps have inductive qualities at certain frequencies and at certain lead lengths. Exactly what they are? I do not have that data either.

I prefer facts to guesses. And guessing and a few bad experiences is all I have to go on at this time.   So I am left with establishing some criteria for my self that I am sure can be a bit of over compensation.

It is well accepted that wire wound resistors are inductive. It seems to me that a spiral carbon conductor around a ceramic core would set up an impedance starting at some frequency. So when replacing resistors in the front end of a Hallicrafters or Hammarlund that is above 18 MHz (18 MHz selected because no carbon film resistor has given me any grief in a finicky Transoceanic) I am not going to take the chance (again) until I see some welcome hard data or spend the time required doing A/B comparisons and testing.

And I would like to post your graphs, with permission and due credit, on my web site for all to benefit.

Thank you in advance for the extra digging,

email: paul at ppinyot dot com.

Paul P.

Hi,
I'm a bit of a stranger to RRAB as I mostly visit RAR+P for civilian sets (my main hobby.)
However, I am helping restore a 1944 Lancaster bomber at CASM (see http://casmuseum.org/about.shtml); my part is the avionics, in particular a Bendix RA 10DB comms and DF receiver.

We acquired this receiver "new in box", unissued, clean and complete, with a test report dated "3/2/44" - a good start! Unfortunately, the "new" Bendix dynamotor type DA-TA is seized up (tried it on a variable low voltage DC, the current spiked up, no motion, switched off fast!) It last ran in 1944 and for the last 65 years has been in storage. My guess is the bearing grease has congealed and/or the brushes have stuck firmly on the commutators. I just hope there is no rust between the armature and field core. Is there any expertise, or any instructions, out there for servicing this unit? If so, I would really appreciate a few pointers from knowlegeable people. BTW, we'll be running the radio off external power supplies (app. 250 VDC B+ and 28 VDC for the heaters) but we'd still like the (disconnected) dynamotor to be servicable.

Another thing: the band switch is motor driven. I've not checked this as we have not yet wired in the tuning unit, but it crossed my mind that this motor, too, could be seized. Can the band switch be operated manually (case open, of course), or, if motor OK, by a simple external switch (I can probably figure the latter out.)

Many thanks for all replies.
Cheers,
Roger
PS. Feel free to email me at "analogdino at(ta-boy) rogers dot(ty-as-they) com(e)", suitably decoded. Visible address is fake for anti-

spam. Thanks again.

FS: R.L. Drake TR-6 6 meter transceiver with NB-9 Noise Blanker, no power supply. The transceiver works great. It was completely gone through, aligned, and checked out in November 2003 by Jeff Covelli (WA8SAJ) and seldom used afterwards. This is a high Serial Number TR-6. It is 478. Comes with a nice copy of the manual in a notebook binder. Physical condition is very good. All documentation of the work performed by Jeff is provided. Price is $675 plus shipping. Digital pictures available. Thanks, Charlie Hugg, K5MBX

The big Bendix dynamotors have ball bearings, the little ones have sleeve
bearings. Remove the two screws from each bell end and look inside. You
will soon see what is up.

If they are sleeves or open ball bearings, squirt a little turbine oil
into them and rock the thing back and forth. Check the color of the
oil coming out... if it's not rusty, don't worry about it. Clean the
open ball bearings out with any reasonable polar solvent (even WD-40 is
probably okay) and repack with Mobil 1 Racing Grease or a high stability
instrument grease.

If they are sealed ball bearings, take 'em out and remove the shields
and look inside.

Also, of course, open the brushes and check the brushes to make sure they
aren't stuck.

I have seen dynamotors that looks fine outside but were a solid clot of
rust inside. You'll know when you pull the ends and look inside.

Yup. I'd also check all the paper capacitors for leakage before applying
actual power to the receiver.

Scott, many thanks for your reply.  I'll pull the ends off the
dynamotor, take a look inside and proceed along the lines you suggest.
As for the band-switch motor, I think I'll pull that assy. right out
(carefully!) and free up the motor before working on the logic - this
may give me an obvious manual band switch change.
Re. paper caps:  I've already put up to 200 VDC on the B+ (heaters not
powered, very slow voltage rise), and the current draw is:
-- at 100 VDC, 10 mA
-- at 200 VDC, 26 mA
I sensed that the current went down just a bit over the first hour of
so, suggesting a electrolytic or two is forming.  I think C77 and/or
C78 near the B+ filter are electrolytic, plus another, but it's not
marked on our unit - just looks like one, i.e. a greyish can with 3
tabs.  I'll see if I can diagnose any DC leakage in the paper/mica
caps in circuit using a DVM "creatively" - I don't want to pull any
out yet as they are very solidly wired in ("military wrap" very close
to component, plus solder.)
Thanks again.
Cheers,
Roger

Dear Friends,

I have come across a company LiveYourDreamsIndia, they are the No:1 in website design, search engine optimization.

http://www.liveyourdreamsindia.com

If you want high quality and professional website to boost your business, they you have to design your website from LiveYourDreamsIndia.
As we know, the entire purpose we create website is to attract customers.If your website is not high quality and professional, your customers will go for your competitor who is of high quality.So since your website is your online marketing person, you must create a high quality and professional website.

LiveYourDreamsIndia's expertise include,

Web design, search engine optimization,ecommerce applications,web application software development,database development,corporate presentations etc etc

They are the No:1 in,

Web design ,web design india,web design chennai,website design tamilnadu,search engine optimization india,SEO chennai,Ecommerce application,software and application development..

Reach them for their excellent service and support.

for more information please mail to them
contact@liveyourdreamsindia.com

http://www.liveyourdreamsindia.com

Thanks
Sree

Results, all good:
-- took off end caps, very clean inside, no rust
-- freed-up armature by hand, moved easily, not stuck
-- removed bearing end plates, bearing grease looked a bit congealed,
added some "electric motor" oil to thin it a bit
-- commutator and brushes in perfect shape - factory new, of course
(there are several new brushes in small metal cans actually stored in
each end of the dynamotor - great idea!)
-- powered it up unloaded on var. DC supply, it started to turn at
below 12 VDC (I did not record the exact value), ran it up to 28 VDC,
about 262 VDC open circuit on the B+ supply line
-- added 10 Kohm load to B+ line, 255 VDC loaded (~ 25 mA DC)
-- ran unit for 1/2 hour to mix the bearing lube and polish
commutators/brushes
-- unit now starts to turn at 2.6 VDC (unloaded)
-- reassembled and put back in chassis pending radio test.

Correction: title error. It's not "280 VDC", it's "230 VDC" (I read
the label wrongly)

Pretty good after 65 years on the shelf. Prognosis for band-switch
motor now seems good! But not looked at yet.
Cheers,
Roger

That's very good news.

Can I touch you? Maybe some of that incredible good luck will rub off.

A question for those with Hammarlund experience,

I have just restored my first HQ rcvr and the manual says I need a sweep generator and a scope to align the IF. On most of my other rcvrs (Hallicrafters), I just use a signal gen and a VTVM. Is this really necessary or can I just peak the IF's? Mike KF6KXG

I have one of those, exactly, and I just peaked the IF stages. What was
interesting was getting the frequencies on the dial to be exact. I used
WWV as much as possible and A.M. radio stations that I knew the
frequency of. If you want it to be absolutely right on you will need a
signal generator (digital preferred) and a counter if you don't have a
digital generator. A sweep generator is nice to have but not that many
people have them laying around the bench.

Good luck with that, my 129X picks up the whole world quite nicely and I
think you will be very happy with it.

If you're lucky enough to have a ramp or triangle generator and an RF signal generator that will do DC-level FM, you can feed the ramp or triangle output into the siggen's FM modulation input and get a very good approximation to a sweep generator. I do it with a ramp fed into my HP 8640B's FM modulation in. Feed the stage output into the Y on your scope and the ramp input into your scope's X, and you get to see (modulo tweaking things so that the scope display, sweep rate, start and stop freqs all are what you want) a really good idea of what the response curves look like.

A dead-simple ramp generator is a constant-current generator (read LM117 or LM317 or LM318 with one resistor, if I recall correctly) feeding a cap of the right value, a 555 to reset things periodically, and maybe a few other components. The LM117/317/318 datasheet at national.com has schematics for constant-current regs; I think I'll play this weekend.

The HQ 129X and its earlier versions use over coupled transformers in at least one position. While these can be just peaked the tuning will not be right although the set will work. A sweep generator and scope will allow proper tuning. The overall IF curve is supposed to be relatively flat topped and have good skirts neither of which will be obtained by simple peaking. I haven't looked at the tuning instructions but it may be possible to determine the right frequencies to peak the individual coils in the IF transformers and use a very accurate source to peak them. That's no trick now since the frequency counters in some multimeters are quite accurate enough.

I also suggest that a good signal generator with known frequencies will be helpful in adjusting the RF sections. The frequency calibration of the main dial should be reasonably accurate and RF tracking good. This was a deluxe receiver in its day. However, it has only one RF stage so it will have images on the higher bands. Hammarlund chose to use three IF stages to obtain better selectivity and leave the RF with a single stage. A combination of both two RF stages and three IF stages is found in the Hammarlund Super-Pro, perhaps the best communication receiver built during its lifetime.

I have an Hammarlund HQ-145 which in some ways is a lineal
decendent of the HQ 129X (which I also once had) and the
HQ-140 which was described at the time as a miniature tube version of
the 129. The manual I have for the 145 states that the sweep
generator and an O'scope are ideal for alignment, but lacking those
a VTVM and a signal generator will work as well if not "as well as."

I haven't tried either method with my HQ-145. I just did the peaking
thing when I had an HQ-129X some 40 years ago and it seemed to
work just fine though I had nothing to compare it with.

Jon W3JT

Thank you to all who replied. I am going to mark the initial positions
so I have them for a reference, and then try the peaking method. Since
I changed all the caps and some resistors, it should improve things a
bit, although it works pretty well right now. The biggest problem is
dirty contacts on the top band of the bandswitch. I sprayed them once,
but will now clean them more thoroughly. 73 Mike KF6KXG

Hello:

I will be bringing the following items to the Newington CT flea market on
Saturday, June 20th:

Two Alpha 78 amplifiers
Kenwood TS-850S
Kenwood TS-50
Clipperton L (needs new cord)
Yaesu FT-411
Astron SS-35
MFJ-971

And much more still to come.

Bob, W1CNY

Crazy question re foregoing!
The Hallicrafters S38 and S53 were post-war receivers; correct?
So that extra wire would have nothing to do with that war time ruling
that there were instructions that the short wave-bands of receivers in
certain parts of North America, during WWII, be disabled to
(supposedly) prevent enemy spies from receiving instructions via short-wave?
Sounds like some of the same paranoia that we hear today!
More personally; in Britain, I recall as a child during WWII,
listening with my grandfather to propaganda broadcasts from Germany;
just a short distance across the North Sea.
Particularly to 'Lord Haw Haw' (William Joyce), who operated much in
the manner of Tokyo Rose; trying to disseminate false information and
British public dissatisfaction with Allied governments and military
commanders. Didn't work btw.
Some of his material was greeted with guffaws and remarks such as
"That's the third time he's sunk that ship"! After the war it was
ruled that he was a traitor, having held a British passport, despite
claiming an Irish grandfather and he was hanged. Also recall my father
sarcastically remarking "Pity they hanged him; he could have continued
his career as a radio comedian"!
Thanks for reading.

This seems to be the best explanation yet of why that wire was there.

PP

news:20bf27a8-5ab2-42f8-a8be-cd077293ecca@z20g2000prh.googlegroups.com...
. I have had an S-38 on the shelf for a few years and
finally got
around to recapping it this weekend. All went well and it
does play
but not as well as I figure it should. I did find one loose
wire that
is attached to S1B terminal �O� and goes nowhere. There is
another
lead attached to that same terminal which goes to the
antenna terminal
lug 4. I don�t see this extra lead on the circuit diagram
and it does
appear to be a lead that was there when the rig was built.
It look
like a cream colored lead with red stripes. I wonder if
anyone has
any idea where this lead is supposed to go? I

Karl sent me a photo via private e-mail. I opened and looked at my S-38 and it does not have the wire he indicated. The wire goes from the antenna tank section of the bandswitch to the RF grid of the converter tube. The schematics do not show any other connection to this point nor is there any sign of on in my RX. I can only speculate as to why this wire was added. Hallicrafters made almost continuous changes in the details of their receivers so its possible this is a factory job but I doubt it.

My S-38 is evidently a late one because the cabinet is finished in black wrinkle rather than the earlier black satin finish.

IIRC it was only $100 new in the store. Of course I could be wrong.
Regardless it is a great radio for what it is.

Could this have been somebody's fix to work around a bad rf coil?

Maybe but having an untuned input to the converter would cause all sorts of problems. Since the set works without the wire connected it suggests the coil is OK but its easily enough checked.

The wire in the photo he sent _looks_ genuine enough, at least its the same type of wire used in the rest of the thing. Very puzzling.

FS: Very rare R.L. Drake TR-6 6 meter transceiver with NB-9 Noise Blanker
and MS-4 speaker and AC-4 power supply. Also included is the rare Drake
CC-1, SC-2, CPS-1, and the TC-2 2 meter transmitter with a set of spare
tubes. The station works great. All of this equipment was completely gone
through, aligned, and checked out in November 2003 by Jeff Covelli (WA8SAJ)
and seldom used afterwards. Serial number of the TR-6 is 478. Comes with
original manuals for the SC-2 and TC-2 and a nice copy for the TR-6.
Physical condition for all units is very good. All cables included as is the
documentation of the work performed by Jeff. Price is $1975 plus shipping.
Digital pictures available. Thanks, Charlie Hugg, K5MBX

```

I know this topic has been covered exhaustively on this forum but I think I may have dozed off.

I am interested in opinions about cleaning rotary wafer switches? For years my preferred method has been to use a plain old pencil eraser which has always worked well. However my current project is a tube tester with a dozen multi-section wafer switches and there is most likely no way I can get into the middle sections with any sort of tool without probably doing damage. CAIG Deoxit D5 is my cleaner of late however I am interested in any suggestions you may have for other cleaners that are safe for wafer metals as well as the phenolic material they are crimped on.

Thanks.

WA9VLK

This can work, but it can also remove plating, which is very bad.

DeOxit is a good choice. However, if the plating on the switches is damaged,
no amount of cleaning will help them.

I have used CRC Contact Cleaner for years with success.   You can buy it
from Home Depot or Lowes in the electrical isle.

If there is oil in/on the phenolic I have lightly scrubbed the switch with a
soft tooth brush and denatured alcohol. Then used a blow drier for 15 mins
to evaporate any alcohol or moisture before powering up.

Paul P.

I know there are several Vintage SSB nets listed ,but, I have not been
able to hear one on the air..I have a collection of early SSB gear and
would enjoy excercizing them on the air..Anyone interested in having a
Vintage SSB net on 40 meters..It would be fun to hear those old tube
rigs on the air,Talk about repairs,restoring,mods,finding parts
etc..What say? Harold

>

You need to get on the air and just "break into" conversations and start asking everyone if the know where these nets take place.

Try google searches on various search terms and see if you can find websites devoted to topics of your choice.

You might have better luck on 75 meters, but I can also tell you that activity (as in ragchewing) on the ham bands has been on the general decline for a long time. I listen and get on 75 more than any other bands, but generally tune across 40 and 20, just to see what is going on. Sunspots are not too high these days, so that is another inhibiting factor.

I have a Viking II that the glass in the meter came loose. I'd rather not disassemble the front panel (since it looks to be a lot of work) to remove the meter which is behind a RF proof shield, so I'm thinking of just gluing the glass in a few spots. What would be good for making the glass stick to the meter case?

73, Bob AD3K

Count me in Harold,
Although my current station for BA is a bit new- Kenwood Twins- they sound great and look great.

It's really not a bad chore, Bob. I've had the tuna can off of my Viking II meter several times the last few months.

But I understand your trepidation about the chore itself and the Viking II is certainly not a "pocket portable." Short of dismantling the tuna can my suggestion would be to make a "strap" of some highly adhesive tape (like packing tape), bend the ends outward to attach each end to the face of the meter like two flanges. Use any bonding agent that is made for glass (DUCO I have found to be good). Super Glue? Uh-uh. Super Glue is the most overrated glue on the market. They make a version that is "for glass" and it is like trying to glue something with the crust you wipe out of your eye in the morning. Drop no more than a miniscule drop of cement in each corner of the meter opening while pulling on the tape "strap" then secure the strap somehow to keep the outward pressure on the meter glass until the glue sets up. Don't get too liberal with the drop of glue. I also wouldn't try to put a drop at the 12 o'clock upper part of the Viking II unless you can physically rotate the whole transmitter upside down to prevent the drop from dripping across the meter glass which could become a mess to clean/scrape off. In the bottom two corners if it oozes slightly to the southwest or to the southeast you risk getting it on the meter movement...then you have a real problem. Reconsider swallowing hard and removing the meter. Once you disconnect the meter leads the rest comes out and comes apart easily. Good luck.

WA9VLK

Thanks Paul and Scott for weighing in with your thoughts. I "sucked it up"
and blasted all the sections of all the tube tester rotary wafer switches

with Deoxit D5 last night. The tube checker works great now. I had been having some anomalies on a box of new 6146s I got and couldn't believe all of them were equally erratic. I also had been having a problem with the needle hanging up. I tried the old Navy kitchen detergent trick and it still hung up. While I was blasting away with Deoxit I removed and dismantled the meter...did a treatment of kitchen detergent INSIDE the meter face....and the problem went away. Not only to I have a nicely flowing and well damped meter movement now but I also have a very, very clean meter case to look through!

Paul...I am going to look for some of that CRC tomorrow. Deoxit is good but I am always interested in trying something else.

My best,

WA9VLK

You don't have to remove the front panel. The meter shield can be removed from the rear. Once you get it off, use the correct size spintite and remove the meter mounting nuts and lockwashers. Pull the meter out the front and disassemble the case. The glass retaining collar has probably slipped back and is no longer securing the glass. Once you remove the meter movement, have a look see if that's the case.

If the ring is loose and won't secure the glass, you can use a couple of drops of super glue on the inside lip of the meter case and drop in the glass. Then slide the retaining ring in. If the ring is very loose, one can deform the inside lip just a bit at one point to provide some tension. The only thing to be careful of is to make sure the zero-set pin on the case aligns with the zero-set loop on the movement, itself, when re-inserting it.

The following fully-operational and re-capped/aligned collector quality units are available in the MD-DC-NoVA area. I'll also be bringing some of these to local fests in the next few months, or by request. I have the manuals for all the equipment.

RME 45 w/ matching spkr ($280)

Hammarlund HQ-140 ($280)
Hammarlund HQ-150 ($280)
Hammarlund HQ-170AC w/S-200 spkr ($325)
Hammarlund HQ-180AC w/ S-200 spkr ($450)
NC-183 w/ matching spkr ($325)
Hallicrafters SX-100 MkII ($325)
Hallicrafters SX-117, HT-44, HP-23A, matching spkr, D-104 mic ($575)
Heath DX-35, VF-1, AM-2, Astatic JT-30 mic ($200)
National HRO-50T, w/ A,B,C,D coils and box, w/ matching spkr ($400)
Mackay 3001A VLF/LF Receiver w/ iso xformer ($200) (as new)
RCA Radiomarine R-203A/URR (8506A), w/ shockmount, w/ iso xformer (as
new) ($295)
BC-348R (Belmont) new a.c. supply, book, re-cap A+ cond. ($225)
Drake C-line, R4C, T4XC, AC4, MS-4, C-4. (Rec has approved p.s & audio
mods) ($800) (Available: S&S Engr. DVFO for 2-30 MHz ops., add $250)

Also have:
TCS-13 system, Rcvr, Tx, C-Box/Spkr, Tuner, shock-mounts and mtg plates,
mic, all w/matching ser. no.s. Original book and a.c. supply included.
($650)
Chinese XD6/106E radio set and field case, all accessories incl
generator, 115v a.c. supply, spares, books, etc. This is a special
setup used by NVA Corps-level units, as researched by Ft. Monmouth.
JPEGs on request. ($500) (As-new cond.)

Harold,

I don't have a late copy of Electric Radio but there are several nets active.

On Sunday the Hallicrafters net starts out at about 1900Z followed by the Vintage SSB Net run by K5LYN, followed by the Heathkit Net. Frequency is 14292 or there about.

There is a Wednesday Hallicrafters net at dark and there is a Drake net on 75.

You can find the hallicrafters reflector on qth.com to give you more detail.

There is a Collins group that meets on 75 too.

I think someone did try to start a vintage SSB reflector on yahoo but I have heard nothing more.
I have problems with yahoo altho I am on a KW Electronics reflector from the UK covering the KW 2000 series and other KW gear.

DO NOT purchase "Lectra-clean" in the larger taller can. It will eat and
melt plastics. They are side by side on the shelf. If you are degreasing
Bakelite or motors it is great stuff.
http://www.home-improvement-superstore.com/crc-industries-02018-19oz-lectra-clean.html

This is the stuff:
http://www.home-improvement-superstore.com/crc-industries-02130-11oz-qd-contact-cleaner.html

I think those prices are for a case of 12. Links for picture reference only.

Paul P.

FS Swan 500 HF transceiver and Swan 117XC Power Supply from an estate. No power cable for the Power Supply, so have not been able to check it out. Both units look very good. Cabinets have the name of a previous owner etched in small letters, but otherwise cabinets look almost new. The original manual is included. Price is $165 plus shipping. Pictures available. Thanks,
Charlie Hugg, K5MBX

This is a simple but effective solution, also cheap. Go to the medicine cabinet and get some dental floss and cut off some small lengths. Slip those pieces into the meter glass and holder. Cut a small thin piece of plastic strip and use it to pust the floss deeper if you desire. If the color is a problem to you , take a soft no. 2 pencil and darken the floss beforehand. Any smears can be easily wiped away with a clean cloth and water. Hope it works. John K4ZYF

I hate it when manufacturers make entirely different materials over a period of years, yet they continue to use the same name. I once did a search for MSDS (Material Safety Data Sheet) information on Lectra-Clean. I found at least six different mixtures with the same name. European compositions were different than those in the USA, and those in Australian and New Zealand were different still. Some of the compositions were relatively benign to most plastics, while others were quite aggressive in attacking most plastics. One formulation even contained hydrochloric acid, but I am sure someone confused one cleaner for another when adding it to their database.

Be sure and get the PROPER MSDS information before using any solvent-based cleaner.

Thanks for posting the solutions to this. My Viking One is exhibiting the loose glass syndrome as well. Access is much simpler of course, due to the complete lack of meter shielding.

In addition to loose glass, the meter face of mine (not the glass) has
sprouted a few dark spots, possibly mold, on the white background on
either side of the "Viking" and below the meter arc increments. I'm
thinking of lightly dabbing those spots with bleach, but I'm concerned
about possible damage to the white background on the scale. Anyone
have any experience with cleaning up the surface of the meter face?

Thanks,

Rob W1AEX

I am looking for one (or more) crystal sockets (preferably ceramic) for the FT-171-B crystal and/or the DC-34 (or DC-35).

I am aware that the FT-171-B will fit into standard banana jacks. I am also aware that many amateur radio operators used vacuum tube sockets, but I am looking for a crystal socket.

For example, the Hallicrafters/Signal Corps BC-610 tuning unit has a crystal socket for the FT-171-B. I am not certain what type of DC-34 crystal socket was used in the BC-669.

Also of interest is a ceramic (or possibly, plastic) 3-terminal socket for the FT-249. These were used primarily in crystal impedance meters of the time such as the latter versions of the TS-330/TSM.

I am a crystal historian who is constructing a test fixture for measuring the electrical parameters for many types of crystals. I have a few hundred crystals to measure and I want to avoid using adapters whenever possible.

Hello,

I'm the owner of an SP600 now aligned, and receiving well. The only issue I'm stuck on is the signal strength meter is not reading. The AVC (?) side where it reads modulation works when switched in, but no S reading. This indicates a live meter, but why no signal strength on any signals? Strong or weak, nothing registers. Any ideas or suggestions?

Thanks,

GB

Watch out! Some inks are water soluble. I found out the hard way when I wiped a dial scale with a damp rag.

Are there any AR88 enthusiasts in Australia on this group?

Anyone (in any country) know anything about the RAF variant (R1156A I believe)? It appears the same as the normal one except has an earthing plug for the mute fitted to the rear (a plque syas fopr the Control Unit type 88). I've just acquired one with leaking bathtub condensers.

Where do the AR88 people hang out please?

The S meter reads carrier level at the detector and is switched off when in Man RF gain contol. Make sure the momentary meter switch is working properly. You can squirt some contact cleaner into it around the terminals. I've had one go dead until cleaned. Other than that make sure the side of the AVC-MAN switch that connects the meter is good. Again, some contact cleaner there may fix the problems. Also, check the meter level adjustment to make sure its not all the way off and is not open. This is a very simple circuit and not very much can go wrong with it.

BTW, the meter will vary with the modulation level on AM because the AVC time constant is so fast. You can slow it down if you like by hanging a capacitor across the AVC terminals on the back of the RX. This will also cure low frequency intermodulation distortion in the audio.

Thanks Richard,

I will give this a try. There's been a garden variety of
contact
problems with this receiver because of where it was stored,
so on.
Hopefully this may do the trick. Again, thank you for your
help.

Thanks,

GB.

      First thing make sure the RF Meter adjustment on the
back is turned up. If turned down all the way the meter
won't register.
      SP-600s are great receivers.

Since no one else has responded I got curious and did a little Google
searching. Beside a lot of general stuff on the AR-88, CR-88 and other
variations I found some discussion of the very thing above at:

http://www.vintage-radio.net/forum/showthread.php?t=3D21717

     This may have the answer for you.

     BTW, these are very good receivers.

Yes sir, I believe I did that but next time I tackle work on the rig,
I'll look at that as well.

Thanks,

GB.

The bathtub caps can often be "rebuilt" if you want something original looking. You need a large soldering iron to get the bottom off. It isn't a matter of heat but of mass to be able to get the thing off. They were probably soldered on by dipping in a solder pot. Once the bottom is off you can melt out the potting compound. Most of this is a wax mixture which will flow out. Most of it smells pretty bad so do this outside. The original cap can then be removed and replaced with a modern one. That can be held in place with a bit of silicon rubber or even some of the original potting compound melted back in. The bottom can be tacked back with the soldering iron.

I think this is a lot of work in the interest of appearance but a lot of people care about that.

If you have one bad electrolytic look our for others of the same type.

Who makes the pot? Someone may have a replacement switch section.

Also, you may be able to burnish the switch contacts and clean them up a bit.

Yep.  It was the head-butt-style jerks and the cesspool environment
on 75M and 20M that drove me to check out 6M some 12-13 years ago.
I've never looked back.

Amen brother...When mobile, I use 17M if I need to be on HF. Otherwise,
I am like you...I have 6M through 1296 plus 10 GHz now. Well, actually,
I just finished up building the 1296 transverter today and did a quick
checkout on the TX side...only 2 mW...should be about 20 mW, so I have
to check into it, but I'm busy finishing up the checkout of a customers
1296 unit today so I can get it shipped to him (I built it for him).

Hi Tony,

you'll find a photo of the original loudspeaker of the AR or CR88 in the CR88
manual
available as a .pdf file from the very famous BAMA site or its mirror EDEBRIS.

Link below:

http://bama.sbc.edu/rca.htm

You'll find the CR88 manual in the list.

73

Joe, does the receiver hear the atmospheric noise in its most insensitive
spot?  As long as the receiver can hear the natural noise level around it,
what difference does it make if it's sensitivity is 10uv or .01uv?  The
answer is NONE.  With all the racket on HF, a super-sensitive receiver is a
CURSE, not a feature.  All the new radios are way too sensitive for HF with
their stupid S-meters showing S more than 1 with no signals.  You end up
listening to racket and riding the AGC level control.

It's crazy....

I have for sale several E.F. Johnson Matchboxes/Antenna Tuners: 1. Model 250-23-3. This is the small 275 watts AM tuner(good for over a KW PEP SSB). It has the built in SWR Meter and outboard Coupler. Nice shape. Price is:$135; 2. Model 250-23. Small tuner as above but without the Meter and Coupler. Good shape. Price is:$85; 3. Model 250-30. This is the Large KW AM tuner(good for much more on SSB). This model does not have the Meter or Coupler. It is in very nice shape. Price is: $275; 4.Model 250-30-3. Large KW AM model as above, but it has the Meter. Requires Coupler not supplied. This one works but is rough cosmetically. Digital pictures available. Price is $135. Shipping is FREE within CONUS for all tuners. Thanks, Charlie Hugg, K5MBX

I had one of these a while back. The first thing I noticed about the HQ-145 is the lack of real electronic components within a huge cabinet. There is plenty of real estate there! Some of the circuits are pretty much bare bones and this includes the conversion/oscillators. When the second conversion oscillator "Kicks In" it makes up for the overall gain that was lacking on the lower band which was single conversion. The HQ-180/160 didn't P-600 so I suspect they were the top design and all the others just had stuff taken out to cut the overall cost of the receiver. This radio was one step up from the single conversion HQ-100 which suffered from image rejection problems fixed by the double conversion of the HQ-145. I think the double conversion setup was minimal and could have been more well thought out to balance the gain a bit better.

if you are in the houston area on the 23 of the month the HVRA is having the yearly Alvin tailgate meet.

the Houston Vintage Radio Club is the sponsor but the local ham radio clubs are always invited as well as the audio crowd.

HVRA members support projects such as the BATTLESHIP TEXAS radio display and ham station.

for more information and map you can go to hvra.org

Hi

Do you still have the HM-10?
If so let me know so I can make arrangments.

Richard N0EB

FS: A CLASSIC! An EXCELLENT HALLICRAFTERS LINEAR HT-41 amp using two grounded-grid 7094 class-B tubes. Provides 1200w SSB, 900w CW/FM and 300w AM Input. Only 20-60 watts drive into a broadband input. Full-wave rectifier. Covers 80, 40, 20, 15 and full 10 M. Great SSB output due to robust PS. 21.5" w X 19" deep X 12.125" high. Pi-section output, metered. Operates on 117VAC, Wt is 85 pounds. This amplifier has been completely gone through by R.L. Howard. It has new computer grade caps in the Power Supply, NOS RCA 7094 Tubes, Solid State Rectifiers to replace the 866As. It has a a box fan to replace the open fan and produces more cooling for the finals. Comes with original manual. This amp is being offered as a picked up only at my home in Abilene, Texas or I can take it to HamCom in Dallas. SALE PRICE: $675.
Pictures available. Thanks,
Charlie Hugg, K5MBX

I have for sale several E.F. Johnson Matchboxes/Antenna Tuners: 1. (SOLD)Model 250-23-3. This is the small 275 watts AM tuner(good for over a KW PEP SSB). It has the built in SWR Meter and outboard Coupler. Nice shape. Price is:$135; 2. Model 250-23. Small tuner as above but without the Meter and Coupler. Good shape. Price is:$75; 3. Model 250-30. This is the Large KW AM tuner(good for much more on SSB). This model does not have the Meter or Coupler. It is in very nice shape. Price is: $250; 4.(SOLD)Model 250-30-3. Large KW AM model as above, but it has the Meter. Requires Coupler not supplied. This one works but is rough cosmetically. Digital pictures available. Price is $135. I will split shipping within CONUS for all tuners.

Thanks, Charlie Hugg, K5MBX

Hi all,

I'm looking for a panel interface for a dual cubic that has one missing. I'm after the 2140-1116 rev D, but earlier revs are probably ok as well..

Anyone have a spare about?

Thanks
Greg

I'm looking for a preselector capacitor for a Lafayette HA-350. Unfortunately the manual(s) that can be downloaded do not specify anything about it, except that is dual section.

My guess is that it is a dual 365pf air variable, though almost anything would work for some bands if you did not care about the calibration on the front panel.

Do you, or anyone else reading this have one, or something that might fit?

Note that I am in Israel, and don't have access to pay-pal.

Geoff.

Those aren't the multisection capacitors he's talking about.  The
"red cardboard tube" is the giveaway, he's talking about multisection
electrolytics.

OOPS, well maybe he or someone else has one anyway. It's a nice receiver
stuck on one band because the capacitor is broken.

He may not want to spam the group but he is more than willing to
send spam individually to your email address if he reads it from a
posting. He also sent at least seven other identical postings to
different newsgroups instead of cross posting. The site he
advertises is his. If you get spam, send your complaints to
    abuse@hostmysite.com, groups-abuse@google.com,
and to his posting host abuse@cox.net.
The registrar of his site is Godaddy so you might wish to complain
there too. I have already received spam from this jerk before his
Usenet postings were sent.

I just got an RCA CR-88B receiver in good shape. After downloading the CR88 schematic diagram from BAMA, I realized that the CR88B is a completely different animal from the CR88. To the extent that the CR88 has a single 6K6 in the final audio stage, whilst the CR88-B has two in push pull.

Google does not tell much about the CR88B, other than it was the latest version produced in 1951.

Does anyone have the CR88B manual or at least its schematic diagram. I will pay the asked price.

Thanks and 73

Tony I0JX

My BF loves this watch for a while before i bought it for his birthday. It looks very strong and professional. I'm also happy i got a good deal buying it.
I bought this watch 4 months ago and wear it every day. The watch has a number of really cool features, including the date that never needs to be reset and the stop

watch. The only thing that takes a little getting use to is the second hand, which stops moving when not in direct light.

As others have said, this is a wonderful watch for many reasons. Made of Titanium and steel, it is a proper large size man's watch, but not heavy to wear. The leather band attached to it is heavy duty and will last, and the watch is beautifully designed and eye catching. The bezel (outer ring) is a little loose but easy to turn, and the dial is surprisingly clear and easy to read due to the strong design of the sword hands. The luminosity is brilliant too, as these things go, and will last a decent period. (You will be able to read the watch for the first few hours at night after you switch the lights off. No watch, from any company, luxury brands included, really lasts very long.) It has a perpetual calendar, so once set, you never have to think about it again, as long as it gets enough light.

The watch does have some quirks. You require patience to set it. As others have pointed out, changing the settings requires you often to wait until the hands travel back or forth from whatever time they're currently set at, to the new function you're changing to. Be careful of date setting. Depending on the setting, you have to wait for a few revolutions of the smaller hands before the date window moves, one date. If you're changing the date from the 2nd to the 29th, you'll be there a while. This watch requires commitment! The alarm is not only soft, but SHORT! About 15 seconds at best. The watch is a not really a chronograph. Those extra sub-dials you see don't really function in that way. Yes, there is a limited chronograph function but it is so poorly designed so as to render the watch useless for that function. The second time zone is handy but the alarm is not sychronized to it.

On the plus side, the watch is accurate, never needs to be fiddled with once it's set AND as long as it gets regular light, is very comfortable to wear and gorgeous on the wrist. I changed out my stitching for a Hirsh carbon black strap with white stitching, and it looks fantastic. The lesson is, buy this watch if you'll wear it regularly and don't really care too much about the fiddly details. If you're likely to forget it in closets or cupboards for long periods, beware!
First the summary: I really like this watch for what it is but I am also glad that I read ALL the reviews before I ordered it so I was prepared for most of its quirks. Since I have owned it only for a short period of time I cannot comment on its long-term reliability. It keeps the time to within less than 1s error per week. I like the very low weight for a watch of this style & size and in contrast to one of the other reviewers I don't think that this contributes to a cheap look-and-feel, rather the contrary. The white hands on an almost black background make it easy to spot the time on a first glance. All indicators including the small additional function hands and the date window were precisely aligned upon delivery and stay so in normal use. The date does not start shifting around 11pm as it happens with other watches but it simply switches at 12am, ensuring that one can always easily recognize the correct date at any time. Setup from scratch can be a bit cumbersome during the first time. So, yes, you sure need the manual but it isn't rocket science either. As for the looks of it, it is more shiny than the official Citizen images suggest, you get a more realistic idea by looking at the photographs provided by other amazon customers. But again, I don't agree that this necessaryily gives it a cheap appearance. It is simply a matter of personal preference and I like to look at it. The things that kept my rating down at 3

stars are the following: 1) Switching between alarm setting and time display modes is indeed a pain in the neck. While it still has something charming to it when the hands are making their rounds when switching between the alarm and time modes, I don't understand why the hands are not always taking the shortest route between the two settings. For example, instead of going 9 hours backward (CCW) they spool down 15 hours forward (CW). I haven't figured out yet why this is the case since the hands can run in both directions, CW and CCW. And one thing that is really disturbing is the fact that even if one does not want to change the alarm setting but only switch the alarm on or off, one still has to wait (sometimes for minutes) until the watch has completed its entire multi-roundtrip to display the alarm time setting. Only then can the alarm be switched on or off after which the watch has to make it all the way back to the time display. Now to my taste this is pushing it a bit far. 2) The alarm is as quiet as many others have described it. You don't want to use it as a spare travel alarm clock or as a meeting reminder in any other but the most quiet office environment. It is the quietest alarm that I have ever found in any watch. 3) If a watch has an alarm and a second time zone mode, I think the alarm should also refer to this second time zone if desired. Unfortunately this is not the case for this watch. Second time zone, yes, but the alarm setting always refers to the original zone. Kind of limits the practicality of the second time zone mode. But then if you can't use it as an alarm clock anyway...So in the end I don't regret it at all that I bought it. In fact I like it a lot for its overall design and apparently fine engineering. And last not least the idea to use light and a non-toxic battery to power it. But if any of the abovementioned downsides are of any concern, one should think twice before getting this watch. These quirks are real with no workaround in sight.

Had this watch for now over a year, and I would have to say that it has been one of my best buy choices. I had several comments from friends on how nice looking the watch was. All of the functions on the watch works perfectly, and don't have to worry about opening the back of the watch to replace the battery. For value for money, its well worth it.

The Eco-Drive Perpetual Calendar features a titanium case and deep blue dial. The timepiece features a 1/20 second chronograph that measures up to 60 minutes, 12/24 time, dual time, alarm, date indicator, and power saver function. Additional features include an inner calendar, which automatically adjusts to the proper date as well as leap years through the year 2100. Independent hour hand adjustment makes changing time zones simple and precise. The genuine leather strap features attractive white contrast stitching and buckle closure.

Price:$695.00
Image: http://bestdeallocator.info/image.php?id=B001BQ141G
Best deal: http://bestdeallocator.info/index.php?id=B001BQ141G

I am very pleased with this watch. It's not your typical women's watch - it's got a large face and is heavy - but is still very elegant. If you are looking for something petite and fancy then this is not the watch for you! But if you are looking for a solid, versatile watch this is a good choice.

I was looking for a dressy every day watch with a second hand. I wanted a little bit of luxury, but not the price that usually comes with that! I looked at comparable watches by the same maker, at bloomingdales and have to say, I feel like I got a steal on this watch. It is more striking in person, and I am thrilled with the mother of pearl face. It was listed as simply blue, but has the purple opalescence you'd expect from pearl. The diamonds...well, I know they are there, most people I've showed the watch to, can't see them even after I've pointed them out. The watch is classy overall though, and feels good on the wrist.

The Women's Wildflower Diamond Stainless Steel Watch #5065 from Invicta is a classic timepiece with luxurious details. Featuring a stainless steel bezel set with diamonds surrounding a blue mother-of-pearl dial with silver-tone hands, Roman numerals at six and 12 o'clock, and faceted indices, this glamorous accessory is a spectacular edition to any sophisticated wardrobe. Also offering a stainless steel case, bracelet band with deployment clasp, scratch-resistant sapphire crystal, and reliable analog-quartz movement, this precisely-crafted watch is set to stand the test of time. It is water resistant to 165 feet and is backed by a one-year manufacturer warranty.Wildflower Collection A summon to all stunning sirens. Ever true to the very essence of the source for inspiration, the Invicta Wildflower collection is most deserving of female attention. Capturing the contradictions of its muse, the timepieces of the Wildflower line are flawlessly integrated representations of elegance and strength. Realized with features including diamonds, gemstones, mother of pearl, textured or pave dials and Swiss movements, Invicta boldly embraced the paradox and has indeed found brilliance in the bloom.

This machine is great. The unit is all metal and it matches my stainless steel appliances and looks great on the kitchen counter. I was looking for a machine that would make a true old fashioned malted shake. This machine delivers, it fluffs up the ice cream and milk, to make a thick smooth milk shake. I do not like fast food shakes that are so thick it is impossible to drink through a straw. I am not sure what the other reviewer is doing wrong, but there is no grinding noise and the unit does not stall or splash. There is no reason to move the cup once it is mixing. You must make sure you follow the directions and not put too much liquid in the cup, past the fill lines. If you like old fashioned milk shakes, this is what you need. I have not found any blender that can mix a true malted

shake like this does. I was born in 1960, and this machine makes the shakes that I would get from the local candy store counter.
We had hoped that it could make an ice cream shake but it is very easy to stall the motor. It also is messy, if the liquid get's too thin it splashes outside of the metal cub. It also make a nasty grinding noise whenever the blade hits the cup which in unavoidable. A novelty item at best and not a real mixer unless you are just stirring a liquid which you may as well do with a spoon.
Eclectrics All Metal die-cast Professional style Drinkmixer has two speed motor , and 28 oz Stainless Mixing cup. Dual mixing agitators for the best mixing performance that is great for milkshakes or omelets, or diet drinks . Individually hand finished sterling color with chrome accents is smudge-proof.

I bought a TS-520S a while back on fleabay and found
it had been modified. Two crystals were changed, but they
were in the 10 meter band. Yup, someone had been using it

on 11 meters! A nice AM xtal filter was installed in the CW
position. The mods were actually well done and easily
reversed.

I wonder if someone was trying to do the same mod to
your '520? Look at the freq of the 'new' crystals, and that
will give you a clue.

Steve

That would be easy and a lamp number is one of the first things I looked for
:~) But this lamp only has volts and amps stamped on the base (at least
that is what was embossed. Not all the characters took.). It does have 16v
at 0.15 amps clearly embossed. There is no number in the Yaesu parts list
either.

Sorry but that is all I have.

Paul P.

I have a 1972 Chicago Miniature Lamp catalogue here and I see a lot of 14V
and 18V lamps but nothing in-between.

I'd suggest replacing it with a 14V 0.15V lamp like a 1488 (which is a full-
size bayonet) or a 14V 0.12A mini bayonet like an 1892.   That will cause
it to limit current at a lower level than before, but that gives you a
little more safety margin.

I'd be curious how the original one failed, though.

Snipping here.....

The two crystals are indeed for the 11 meter citizen's
band. They are in the AUX position and the RF attenuator
switch was adapted to switch them. I can't see how these

would affect the other bands but I will remove the mod as soon as I can figure out how the attenuator was orginally wired. BTW, both resistors were left on it. From the schematic this is a dual switch and only one side is normally used. The modifier (a polite term) put the crystals on the unused side but disconnected whatever was on the other. The schematics are difficult for me to read so I will probably re-draw the significant part.

The curious thing about 160 and 80 is that the unit works perfectly well in receive. The same crystals and much of the rest of the vfo circuit is used for both. The handbook suggests that when one band is bad but the others work to check the tuning. I think the tuning is for both RX and TX but, if not, that's probably where the problem lies.

I am having to learn my way around this thing and am being careful not to change anything until I am fairly certain I know what I am changing. As always any suggestions will be much appreciated.

Mechanical failure.

It looks good but does not conduct. It threw me for a while before I
actually tested it instead of looking at it.

One of the first things they taught me in tech school in the 70's. Ohm out
the lamps and fuses.

Paul P.

Looking for a nice 19" rack, either open on 4 sides, or enclosed. Preferably
close to Connecticut so I could pick it up.

I know this sounds weird... but try applying 16V to the thing with a bench
supply and see what happens.

I have seen some lamps that seem to be an open until power is applied
and then they become normal. I don't know what causes it, it's as
if a layer of corrosion built up on a contact somewhere.

Odds are it really IS bad, but five minutes will make sure.

I've a Hoffman RT-159A / URC-4 for sale.

Pics of this type of unit here:

http://www.eetindia.co.in/ART_8800556916_1800005_TA_87563c7c.HTM

This is an emergency tx/rx designed to work on the VHF and UHF emergency frequencies. The sort of thing which a "downed" pilot work use to contact SAR aircraft.

It has telescopic antennas which extend and "fold out" to form a T shaped dipole.

Buttons etc. move OK, as does the antenna.

Unit only- no battery module.

Cosmetic Condition is fair- paint is a bit scratched etc but internals are clean and seem "untouched". Circuit is printed inside cover. Not the sort of thing you can test so I can't be sure if it works. Really a collectors item, rather than something to use.

Offers please, plus postage at cost (I'd imagine �10+ to post but I may be

able to get it into your area (UK) for you to collect if you aren't in a
hurry for it! UK only please- this item is quite heavy.

Email address on my website.

These are ballasts that help to limit the current on the input transformer winding, or blow if too much. The FT-757 uses a grain-of-wheat bulb tacked onto the board. It is probably not critical, but it should be noted that smaller lamps may coat the envelope if they blow hard, leaving them conductive. Can be a problem with fuses too.

You might find far more information on these units by the full designation URC-4 or more properly the RT-159A/URC-4. The battery supplied 1.5 volts and 90 volts. It was a mercury battery and it was to be carried INSIDE the airman's jacket to keep it warm and operable. The batteries and rubber cables are rather rare these days. I have several of the radios, two batteries, and 2 cables back at my home in Tennessee, along with two original manuals. The tubes are "peanut" tubes and not pencil tubes. The latter name was reserved for RCA's line of microwave planar triodes and diodes. These radios were easy to convert to 2-meters which was discussed in the third edition of Surplus Conversion Manual. The telescoping elements of the antenna were to be fully extended on 121.5 MHz and fully collapsed on 243 MHz.

Please help me to solve my omni-d problem.... It lost 90% of the receive side.I can barely hear signals that were usually 30 over 9.but what gets me it is that I flip the switch in the back to "receive" instead of leaving it in the transceive position and use the receive jack(not the pl-259) and it receive normally.I opened it and checked the relay(contacts) and they are ok....I took a wire antenna and jumped it to the "input signal pin" of the rx mixer and the reception cames back....any ideas guys.......

I used to own an Omni D 546, and I did have some problems with it, but not a
receive problem but an email to TenTech, got me going in the right
direction, and actually the manual that is supplied gives a huge amount of
info on fault finding etc. Perhaps you could try to find a copy?

How did you check the relay contacts? My neighbor, now SK, had one
with a problem that sounds like yours and it was the relay. You cant
always tell just by looking.

Jimmie

Grab the Schematic, ands start looking where the Transceive Input and
the Receive Only Input connect and then follow the Transceive line back
and test each component clear back to the connector.... You will likely
find it in the contacts, but it may be a PIN Diode Switch, or T/R Relay
problem depending on how the radio was designed...

Hi Bot:

Sorry for the delay. The tube tester manual should give you that information - plus the pinouts for the 807 and 6L6. Assuming it is a mutual conductance tester, there should be a switch for each element and you just need to transpose each element.

Or, you could simply make an adapter socket with an octal base and a 5 pin socket, with a wire coming out the side for the plate. Then, plug the adapter into the 6L6 socket and read away. You may have to adjust the pots a bit. It would be perfect for comparing 807s and will show you a dud. Take a known good 807 and adjust the bias to make the tube read good and that may be as good as you need.

73, Colin K7FM

I have a HC-500 Tokyo HyPower Labs Universal Antenna Coupler.

It has been severely molested and I want to restore it.

Does anyone have a copy of the schematic and the manual so I can see what filled the "spare" holes on the back plate?

Would appreciate any help!

I got it working. I found that someone had modified it to get on the 11 meter citizen's band. Two crystals were added to the Aux position using the antenna attenuator switch to switch the crystals. I also found a jumper between two sections of the band switch section on the drive board. The jumper was what was preventing drive for the 160 and 80 meter bands. Removing it got it working on all bands. I removed the crystals but the original wiring to the attenuator switch seems to have been removed. This is not a big deal but the unit does have a reputation for overloading on strong signals so I think I will want to restore the attenuator. Curiously enough the resistors are still on the switch. This is a two section switch and, in its original configuration, evedently only one side was used. The modifier (to use a polite term) used the free side but disconnected the antenna wiring. From the schematics the original wiring was apparently a couple of lengths of shielded wire from somewhere around the "EXT-NOR" antenna switch to the attenuator switch. If anyone is really familiar with the inner workings of the TS-520S It would be helpful to me to know how the original wiring was done and dressed. Its impossible to see it in the photos in the downloadable instruction book even though these are pretty high res pictures. Its just not shown there.

In any case, I can get the thing on the air as it is, all I need now is a stealth antenna:-)

I have an FT-101 on the bench with out the 10D crystal of 35.52MHz (HC/25U). This is a common problem when the unit has been modified for a different band (like CB). This crystal provides operation up to 30MHz and 30 MHz operation is needed to properly set the alignment of the three preselector coils.

Before I order a new one from ICM, does any one have one they care to part with? If so please email me.

Thanks for looking,

Paul P

Lots of Boatcanchor stuff (and AM) in the new book:

SolderSmoke -- A Global Adventure in Radio Electronics
From Crystal Radios to Podcast MP3s
With Occasional Forays into Astronomy, Kite Aerial Photography, and Model Rocketry

SolderSmoke is the story of a secret, round-the-world, after-hours life in electronics. Bill Meara started out as a normal kid, but around the age of 12 he got interested in radio... To make matters worse, when he got older he became a diplomat. In all of the places he has lived, his hobby caused him to seek out like-minded radio fiends, to stay up late into the night working on strange projects, and to build embarrassingly large antennas above innocent foreign neighborhoods. SolderSmoke takes you into the world of an expatriate geek. It is technical memoir filled with both funny stories and serious descriptions of Bill's struggles to truly understand the theory behind the equipment that he built.

My intention was to produce a book that is both fun and useful. The memoir part of the book is filled with what I hope are funny stories about my life as electronics-addicted diplomat. The useful part comes from the portions of each chapter in which I describe my struggles to really understand the theory behind the circuits that I was building. Throughout, I try to lace the text with inspirational descriptions of the fraternal, cooperative, international aspects of ham radio, of what we call "The International Brotherhood of Electronic Wizards."
In short, its the kind of book that a techie would like to take to the beach.

Here is the web site -- it has the cover photo and a preview of the first chapter.

Does anybody have a good guess at the B+ current draw on the SW-3 using
58s or 6C6/6D6?

Thanks

-Bill

Never mind. I forgot about my AES power supply. I hooked it up and
measured it. Runs 21-22ma with 135 volts.

Thanks, interesting pictures. I'm not sure that I agree with your comment about hams not build things ANYMORE. There have always been people who build and people who buy.

After looking at the prices of some of the parts on the tables outside, I would understand why no one was interested. Some of the things, like the CRT's you were selling were cheap enough to buy two and if one breaks or turns out to be a dud, you still have a spare.

Others looked like the could be cleaned up, mounted on wood and used for a decoration, but had a very small likelyhood of ever working, sold at NOS (new, old stock) prices.

Yes, I really could see that from the pictures.

I doubt that anyone would have spent a lot of money on one from an anonymous
"ham" with no way of testing it or being sure he could return it. While you
said you test everything you sell, many vendors do not, and some do, but sell
the duds at hamfests as good quality.

I once saw at a hamfest back when I lived in the US, a relatively new Kenwood
rig sitting at a table for $200. It was sold as "finals blown, unrepairable".
Half an hour later it was at another table as "untested" for $900. It had
obviously sold the first time, and later when I passed by, again.

Geoff.

I have for sale Drake TR-7 manuals. Original manuals I purchased
myself in 1980.
One is the one that came with the rig and the other is the factory
service manual.
Also included is the modifications for MARS operators to use the unit
on freq.
outside of normal amateur bands. Being in Navy Marine Mars be advised

I will only send these to buyers who can prove without doubt to me that they are legal.
The manuals are in very good to excellent condition. The outside of the manuals are a bit dirty otherwise due to no use in years. I have cleaned them up so they do appear better. The insides are almost perfect. I paid a very large sum when I brought them and will sell them here rather than another IP. I trust most folks here. I just had heart surgury. I need money, but will not give away! Please make your offer and include s/h which will be by USPS one cost plan as seen on tv. My callsign is K4ZYF.
Zip code 29617. John

. I have had an S-38 on the shelf for a few years and finally got around to recapping it this weekend. All went well and it does play but not as well as I figure it should. I did find one loose wire that is attached to S1B terminal =93O=94 and goes nowhere. There is another

lead attached to that same terminal which goes to the antenna terminal
lug 4. I don=92t see this extra lead on the circuit diagram and it does
appear to be a lead that was there when the rig was built. It look
like a cream colored lead with red stripes. I wonder if anyone has
any idea where this lead is supposed to go? I

Was that a "gimmick" (a capacitor made by twisting two wires together)?

Geoff.

news:20bf27a8-5ab2-42f8-a8be-cd077293ecca@z20g2000prh.googlegroups.com...
. I have had an S-38 on the shelf for a few years and
finally got
around to recapping it this weekend. All went well and it
does play
but not as well as I figure it should. I did find one loose
wire that
is attached to S1B terminal �O� and goes nowhere. There is
another
lead attached to that same terminal which goes to the
antenna terminal
lug 4. I don�t see this extra lead on the circuit diagram
and it does
appear to be a lead that was there when the rig was built.

It look
like a cream colored lead with red stripes. I wonder if
anyone has
any idea where this lead is supposed to go? I

There is a readable S-38 manual at Nostalgia Air and I think also at BAMA.

From the schematic neither wire belongs there. The terminal on the bandswitch goes to the top of the secondary of the RF transformer for Band-2. My schematic shows only three antenna lugs and they are not numbered. I suspect that both wires may have been someone's modification.

The "gimmic" mentioned by another poster is used for the BFO and is not in this section of the RX. I have an S-38 and could look at the bottom if you like but have no way to make photos of it.

Hi Guys,
  Thanks for the help so far. I made an error in my posting! The
other lead that is attached to S1B terminal "O" goes to lug 4 on the
antenna coil NOT the antenna terminal.
  I will send you a picture Goeff and Dick
Thanks,
  Karl

4 on the
antenna coil NOT the antenna terminal.
I will send you a picture Goeff and Dick
Thanks,
Karl

OK, when I get the picture I will open the bottom of my
S-38 and see what there is.

You may already know this - C25 inject the BFO oscillations. It is a simple wire wrapped around an detector wire. You can see C25 in this schematic:
http://www.nostalgiaair.org/PagesByModel/862/M0008862.pdf

I do remember finding a strange wire on the S-38 that I recently restored. It killed band 2. I compared the actual circuit to the schematic and put it back to the schematic. You can read about it starting at the third paragraph here: http://www.ppinyot.com/H/s-38.htm

Not documented on the web page, I later ran into "Silver Mica Disease". I took apart the IF cans and added external caps.

Other than that I do not know.
Good Luck,
Paul P.

Thanks for the web page Paul. The wire in the picture on that page
appears to be the same one that I have been questioning. That would
certainly explain why it is not connected to anything. My band number
2 is active so that would also be a good indicator. I did listen to
the radio last ngiht and could receive SW from all over the world on a
4 ft piece of wire.
  Thanks to all who have responded to my question! This group sure is
a great tool for the radio hobby!
  Thanks again. Do any of you have any thoughts or comments on
restoration of an RME-84 receiver? That is next on my list of things
to do!

Anyone know where I can get a schematic (for a reasonable price) for an HP606A signal generator with S/N Prefix 842? The one on BAMA isn't correct for this S/N.

Thanks,
Barry - N4BUQ

I ordered this product and it come within a few days. It also came with extra oil to lube 6 months after use. I would definitely purchase this product again and from this seller.
A durable walking belt of the highest quality, it has an exceptional one year warranty. Its pre-lubed, with an additional tube of lube for suggested use at 6-8 months after installation. Unlike some factory belts, a Treadmill Doctor replacement walking belt doesnt have a foul smell!

I love the smell of this lotion. Actually like the smell better than the smoothing or healing aspects of the lotion. Don't get me wrong, it is a good lotion, smooths and leaves hands feeling softer. But...I really find that Canus and Olay Quench are better for my skin. Like the previous reviewer said, it is an individual matter as to what does the best on your skin. And as I said the scent is wonderful, and I followed a trick I read about on a perfume blog. Use this lotion and follow with plain old cheapo Jovan White musk perfume. The combination is better than just about most of the designer fragrances that use a vanilla musk combo. Remarkably heady beautiful scent. Again scent is highly subjective. If you don't like vanilla or musk or both it won't be for you. But I love the combo and is one of the reasons I buy this lotion. Smell really good and it does smooth and soften skin. I often use the Canus unscented lotion and add this or Quench on top, then add whichever perfume, or none depending on the circumstances. Try it. You might like it.
I have been looking all over town for this lotion. I have had problems with my hands pretty much my entire life. I can tell when "spring" has come to the Northland because my hands start acting up in terms of getting dry and having little heat blisters. I have tried lots of lotions and creams, gone to the doctor to get a perscription, and it was not until I tried St. Ives Soothing Vanilla lotion did I finally find something that really worked for my hands. Granted, it might not work for you. For that matter, you might not like vanilla (I do), but there are other options in the St. Ives inventory for you to check out. I am just about out of this particular lotion and have been stingy using what I have (it will start snowing here this week and I am going to seriously need this stuff), and have been supplementing my meager stash with other lotions, not of which can compare. If you have been having trouble finding a lotion that suits you, then give this or one of the other St. Ives products a try. I cannot give you anything other than this anedoctal evidence to support this suggestion, but maybe lightning can strike twice for you. Most importantly, if you do not like what you are using, keep looking. There has to be something out there that will finally make you happy.
Pure Vanilla Essence & Nature's Finest Moisturizers Come Together In This Creamy Blend That Soothes & Conditions Dry Skin. St. Ives Swiss Vanilla Aromatherapy Lotion combines Advanced Micro-Powered Moisturization with pure Vanilla essence, Milk Protein and Select botanicals to relieve the seven symptoms of dry skin. Soothes and conditions dry skin while providing aromatherapy benefits of pure Vanilla essence. All Day Protection from the 7 symptoms (dry, chapped, red, itchy, flaky, rough and tight) of Dry Skin. Dermatologist Tested. Hypo-allergenic. Advanced Botanical Formula Vanilla - Calming, Sensual, Aromatherapeutic. Milk Protein - Strengthening, Emollient. Honey - Retains moisture in skin. This product not tested on animals.Visit our Village at: stives.comMade in U.S.A.

I'm not sure (and I should mention I meant to say I was looking for a manual, not just the schematic)

There may not actually be many differences. The serial number prefix it shows is for 0960A. I looked again last night and there's an "Appendix I" that covers the changes for the 842 prefix so this manual may be the correct one after all.

Thanks,

To All::

At the Chatham Marconi Maritime Center, home of (WCC Chatham Radio) we have aMackay Radio MRU-19A, which is a complete ship radio station in one unit. We wish to restore this to operating condition for museum display. We wish to obtain the manuals and/or schematics listed below. Please advise if you have anything listed available.

We would be glad to pay for any expense involved and the CMMC would be very appreciative.

Sincerely -- William C. Ryder W1KL

196 Joshua Jethro Rd.

Chatham. MA 02633 wryderw1kl@comcast.net

Mackay manuals/schematics needed for sub units of Mackay Marine Radio unit MRU-19A

As of May 17, 2009 Chatham Marconi Maritime Center

High Frequency Transmitter Type 2013D1F

Main Transmitter Type 2009A

Emergency Transmitter Type 2010A

Auto Alarm Signal Keyer Type 5100C

Auto Alarm Type 5002A

Receiver LF/MF/HF Type 3007A

You might check with Richard Dillman who is involved
with the restoration of KPH. They have restored an RCA 4U
and may have information on the Mackay version or know of
sources for it.

I'm not sure (and I should mention I meant to say I was
looking for a
manual, not just the schematic)

There may not actually be many differences. The serial
number prefix
it shows is for 0960A. I looked again last night and
there's an
"Appendix I" that covers the changes for the 842 prefix so
this manual
may be the correct one after all.

Thanks,
Barry - N4BUQ

I restored one not too long ago. Learned a lot including how to restring the drive cable. I must have worked on many 606As and Bs when I worked for Hewlett-Packard many years ago but was appalled that I remembered so little about them. On mine the rotors of the tuning caps were decentered and the plates had been severly bent to compensate. I had to disassemble the thing enough to remove the caps and fix them. I have just the vaguest memory of something to do with the caps in these guys having problems. Generally, -hp- stuff of this vintage should set up better than specs although there were some real dogs such as early 400D/H voltmeters which were completely redesigned about twice, and some early 200CD oscillators which had several revisions of the circuits particularly the power supplys. I dont' think there were any really serious revisions of the 606A but can't be certain.

Agilent has many -hp- manuals on line in reasonably hi-res PDF form, they may have a better copy than you have. There is also some stuff at the HP Memory Project site.

I've been around the block several times with the BC-348-series of
receivers and understand the B- setup.  I picked up, today, a very nice
"R" model that works, albeit the power transformer is woefully weak for
the job.  The issue I have is that someone made some mods that I'm
trying to buzz out and/or understand if this they are non-issues, in the
end. Specifically, as far as I've been able to determine, the P.S. B-
now goes to ground. The choke that used to keep B- off ground for bias
for the 6V6 has been taken out of the circuit.  The bias B- series bias
resistors 66 and 63-4 now go to ground at the B- end of 63-4.  Was this
an alternative mod way back when?  If I'm chasing ghosts, I'll be happy
to stop the hunt....
Tnx for any insights.

Richard,

This is my frist 606A. I've been digging into this one just trying to get dust off, etc. Pretty impressing mechanicals in this thing. I've rebuilt some R390As and this thing is just about as much fun. Love those large gears that house the oscillator and amplifier coil assemblies.

When I got it, I couldn't turn the range change switch. It turned out to be just dried lubricant on a few parts. I've cleaned and oiled things a bit and it works great now. I was very surprised to find calibration to be on the money for the most part. I tweaked one range at the upper end and I think all the others were very close on the lower end. The only range I can't bring into spec is the top range. Not enough L or C to get it rignt and not sure what to do to correct this.

This one has all HP-branded tubes. It looks like they may have never been changed from the factory.

Thanks for the reply,

Barry - N4BUQ

Larry,

No, it definitely can't hear the atmospheric noise in its most insensitive spot. So I'm pretty sure the gain is lower than it should be at that spot on the dial. Otherwise, you're right... there's no point in having a super-sensitive receiver when the atmospheric noise is what limits your noise floor.

Tnx,
Joe K9LY

Finally got back to the HQ-145 project. Borrowed a 100 MHz oscilloscope to measure the 1st LO injection level at V2-1.
Band: 4-10 Mc, tuned to 10 Mc: 20 Vpp (LO freq = 10.455 Mc)
Band: 10-30 Mc, tuned to 10 Mc: 0.9 Vpp (LO freq = 13.035 Mc)
That's a big difference!

Measured at several freqs in the 10-30 Mc range:

10 Mc	0.9 Vpp
11 Mc	3.3 Vpp
12 Mc	4.7 Vpp
13 Mc	6.1 Vpp
15 Mc	8.3 Vpp
20 Mc	13.0 Vpp
25 Mc	14.4 Vpp
30 Mc	13.7 Vpp

So, clearly the 1st LO amplitude is very low at the bottom of the 10-30 Mc range. The 1st mixer 6BE6 seems to need at least 5 Vpp of LO in order for the receiver to have decent sensitivity. I suspect the LO coil tap point is less than optimal for the low-freq end of the band as the result of some sort of design compromise. (Better-quality receivers like the HQ-180 divide the HF band coverage into smaller ranges so the RF and LO circuits can be more optimized.)

I also happen to have an HQ-100 which is very similar to the HQ-145 except it is single conversion throughout. The difference in sensitivity at 10 Mc on the two band settings was much smaller than on the HQ-145, but still noticeable. I pulled the 6C4 tube from the HQ-100 and tried it in the HQ-145, but the LO wouldn't even oscillate unless tuned to 13 Mc or higher! That was odd.

I couldn't measure the LO level in the HQ-100 because oscillation would cease whenever the oscilloscope probe was touched to the 1st mixer. LO is pulled from the grid of the 6C4 in the HQ-100, whereas it's pulled from the cathode of the 6C4 in the HQ-145. This might be why the scope probe kills the LO in the HQ-100. Other than the pull-off point, the LO circuit appears to be the same for the two receivers.

Well, this has been an interesting exercise. I don't think I'll do anything further about the HQ-145 except maybe try to get a N.O.S. 6C4 and see if it makes any difference on the 10-30 Mc range.

73,
Joe K9LY

The coils on the highest range are adjustable by squeezing or stretching them a bit to change the basic inductance. Set the core at about half way. The coils are cemented to the plastic former with coil dope, AKA Q-dope. Airplane glue will work in the absence of the real thing. What happens is that the cement disintegrates and the coils have enough elastic memory to stretch out and change value.

The frequency calibration should be no worse than half specs.

There were some changes in the crystal calibrator circuit and a couple of other places, I don't remember all of them.

The assembly comes apart much more easily than it looks. One of the screws that fastens the front panel onto the chassis is underneath the modulation meter.

If there is a calibration problem on all bands its likely the dial has slipped. The procedure then is to get the dial back to where it belongs. The dial is held in place by a clamp under the main tuning knob. I don't think you need to do this since all the bands are on but one.

BTW I found a TV type adjuster with a long, thin section between the handle and the allen head end that is flexible enough to fit into the core of the HF coils while they are in operating position. Otherwise adjusting them is a stepwise chore.

These are very good generators and have the virtue of very low distortion modulation capable of 100% which makes them valuable for receiver detector evaluation.

Dear Tony,

I have one of these speakers which I bought for my AR 88 recently on
EBay. Original (1944) MI-22201 from R.C.A. Cost me a fortune!! I could
photograph it and send you a picture but the AR 88 manual also has a
picture in it.

best wishes,
```

All,
After a great many years of poking about, I seem to have acquired a Zenith 7S633 tabletop set. It seems to have taken a home underneath a Philco 38-10 while I was temporarily distracted by the animals. In spite of its age, it is all there and works perfectly. What should I expect insofar as performance in SW? I use an indoor inverted L and an outdoor long wire won't be available. Should I rely on the internal antenna? Were these good performers? I already have fallen for the black dial Zenith, so asthetics are beyond question.Any help or experience with these beauties would be greatly appreciated. And photos are available.
rgds,
Mark S.

I don't have one of these but from its schematic it should have pretty good HF performance. It has an RF stage using a 7H7 tube, which is a high gm pentode, somewhat similar but not identical to the 6SG7 plus Loctal type tubes have somewhat lower interelectrode capacitances than octal base tubes, both of which can improve high frequency performance. The RX goes only to 18mhz and should have good sensitivity right up to the top.

Unfortunalely the service information on Nostalgia Air has only schematics for this and the 7S733R (can't see much difference) with no alignment instructions at all.

As to the antenna, a relatively short indoor antenna will work on any "short-wave" radio but will not have the performance of a real antenna. About 15 feet of wire strung across the room will do but if you want something better you have to go to an outdoor antenna, in the clear, of the right length, and as high as you can get it.

Its likely that this RX needs some touching up of its adjustments, they will have drifted over the years.

SolderSmoke -- A Global Adventure in Radio Electronics
From Crystal Radios to Podcast MP3s
With Occasional Forays into Astronomy, Kite Aerial Photography, and
Model Rocketry

SolderSmoke is the story of a secret, round-the-world, after-hours life in electronics. Bill Meara started out as a normal kid, but around the age of 12 he got interested in radio... To make matters worse, when he got older he became a diplomat. In all of the places he has lived, his hobby caused him to seek out like-minded radio fiends, to stay up late into the night working on strange projects, and to build embarrassingly large antennas above innocent foreign neighborhoods. SolderSmoke takes you into the world of an expatriate geek. It is a technical memoir filled with funny stories and with serious descriptions of Bill's struggles to truly understand the theory behind the equipment that he built.

My intention was to produce a book that is both fun and useful. The memoir part of the book is about my life as electronics-addicted diplomat. But this is more than a memoir: portions of each chapter describe my struggles to really understand the theory behind the circuits that I was building. Throughout, I try to lace the text with inspirational descriptions of the fraternal, cooperative, international aspects of ham radio, of what we call "The International Brotherhood of Electronic Wizards." In short, its the kind of book that a techie would like to take to the beach.

Here is the web site -- it has the cover photo and a preview of the first chapter.

I saw a message the other day that listed this book and another one
both from Lulu. Does anyone know what the other book is?
Thanks
Dave Foreman

Hi all ,
I am replacing the 7146's on my Kenwood 520s and would like to know if there is a certain proceduere I need to go through to neutralize the tubes for optimum performance and maximum life.Thanks in advance .

PS I'm kinda new at this so be gentle :)

Hi,
Yes you need to neutralize your new final tubes. Do a Google and locate
a copy of the TS520S manual and download it. You will find the
procedure in there. Good luck with your 520, its a great set.

The pinouts are completely different. IIRC the 807 is a 5-pin and the 1625 is a 6-pin. If the tester switches are there to swizzle the connections around, they very probably won't get swizzled right by setting it for the 1625.

Not to mention that if it doesn't list the 807 it probably won't list the 1625.

It receives does not transmit, probably needs new finals. Have service
manual included. No microphone. Make offer plus shipping from 70053.

     The operating manual, which has neutralizing instructions, is
available free from the Kenwood site:
http://www.kenwoodusa.com/Support/AMA_Radios/#_
     Scroll down to the "Amateur Radio Manuals" window and select the
model.
    Also, download the service bulletins from the window below it.

Thanks, Colin. That should get me to where the scaling on the meter should be close enough for a comparative reading. But I also have to figure out how to map the letter designations for the filament to pin numbers so that I can go from the pin diagram to settings on the tester. Do you know how to do that?

73,
Bob AD3K

You might ask yourself, first, are the old tubes really weak? i.e. less to much less than 50 watts of carrier output, as measured with a wattmeter into a good load (dummy or real).

You might ask yourself, second, what bands you plan on operating on.

If low (160,80,40 meters) you might not need netralization. All the old handbooks mention that self-oscillation is a problem at the higher frequencies.

There are two classical methods to test for neutralization (after you put in the new tubes):

1. With rig output into a dummy load and wattmeter, can you get RF output with excitation removed, at some setting of grid drive tuned circuit or plate output tuning.

2. You look at grid drive and sweep the plate tuning through its range: if the rig is not neutralized, then you'll get a dip or blip in grid drive.

You can't do this directly with the 520 since it does not register grid drive on the finals. But, you can adjust the drive level knob to at or near zero output. Then, you fiddle with grid drive tuning knob AND, separately, plate tuning knob, and if plate current goes up high and RF comes out (as shown on the watmeter), then you got self-oscillation in the finals. Bad news. You'll have to adjust the neutralization as per the proceedure.

Many old rigs did not have neutralization. DX-100, Viking Ranger, etc., were all 6146 rigs with no neutralization. The Drake twin lines (6BQ6s in final) did have neutralization. Sometimes they worked, sometimes not. I had a single 6146 DX-40 transmitter that I discovered went into final oscillation if I removed grid drive. Bad news. I made my own neutralization wire from bottom of the chassis to the top and moved it closer or farther from the plate of the 6146 until the self-oscillation or grid drive flicker stopped when I tuned the plate circuit. All trial and error.

Good luck

Thanks for your input and everyone elses replies. I did a google search and came up with this URL http://www.k4eaa.com/faq.htm

It was extremely helpful and it gave me a better idea of what I need to get back on the air. Problem now is I don't own a dummy load or RF millivoltmeter so til then I guess I'll be off the air . This sux.

I do it the poor man's way. Watch an output meter and the plate current meter simultaneously. Key down and see if the dip on the plate corresponds with max output.

If not, budge the neut. cap slightly and repeat again. Keep the drive down so that you don't screw up a new set of tubes.

-Bill

I joined the Kenwood list but so far have not received any replys so I thought I would try here.

I recently bought a TS-520S. Its very clean but has a problem in transmit: there is no drive on either 160 or 80 meters. The receiver works fine on these bands.

I can see a modification has been made. In the area of the crystals near the front panel two crystals have been added and use the RF attenuator switch to change them. I tried to see if switching made any difference to the drive but it does not.

I wonder if anyone recognizes this as a common mod for this transceiver and knows how to undo it. I searched around for mods but there seem to be a great many. I have an operating manual from the Kenwood site and a service manual from another site along with a high-rez schematic (those in the handbook are unreadable). Eventually, I will trace this thing down but I was hoping someone would have encountered this before. I don't see any other signs of surgery on this thing.

The only other thing I found was that someone had neatly clipped out one of the wires supplying the fan. Why anyone would do this is beyond me. I replaced the lead and the fan works fine.

Richard,

That 2-crystal mod doesn't sound at all familiar. Can you see the frequency marked on them? Maybe we can deduce their purpose.

A botched mod may explain the lack of drive on 160 and 80. The 520 is such a nice rig, it makes you wonder why people mess around with them like that. How clipping the wires to the fan would be considered an "improvement" by anybody is beyond me!

73,
Joe K9LY

I'm with Joe- and the quality of the mods is usually horrible. As for the
fan wire- probably the owner at that time needed a piece of wire that length
anc color.

I have for sale a beautiful Collins 75A-1 Receiver without cabinet. It works but needs alignment and some of the variable caps in the alignment circuits are stuck and don't turn. It receives well on the lower bands, but has low sensitivity on the higher bands above 20 meters needs peaked up on these bands. It is one of the nicest ones that I have seen cosmetically. I can send pictures if your interested. Price is $335 plus shipping. Thanks,
Charlie Hugg, K5MBX, CCA 307

FS: Yaesu G-400RC(like G-450A except no special plugs required for cable hookup). It comes with a copy of the manual. The rotator and controller work well and are in very good shape cosmetically. Cable hooks directly to rotor and controller/no plugs required. This rotor and controller have not been used much. I can send pictures upon request. Price is $165 plus shipping.
Thanks, Charlie Hugg, K5MBX

I bought a used HW-9 that works well except for dial accuracy. I'd
appreciate comments from other HW-9 owners with regard to accuracy of
theirs.

So far, I've found the 80 Meter heterodyne oscillator crystal is about 5
KHz off frequency. All the others are within about 1/2 KHz, which is
not significant compared to the width of the lines on the VFO dial.

Except for the 80 meter crystal problem, it appears that frequency errors are almost entirely due to VFO tracking error. VFO frequency is correct at 0 and 250, but as much as 10 KHz off in the middle of the range.

One of the VFO capacitor rotor plates is bent away from an outer stator plate. That might be the result of an earlier owner attempting to correct the problem, or it might have come that way from Heath. Can anyone tell me if the stock VFO capacitor plates were originally straight (flat) or bent?

The VFO Shield is missing. If I can find some copper, I'll try to make one, but doubt that will correct the problem.

Fred

Hi Fred:

Many receivers capacitors have the outside plates separated into sections, like a pie. This is for the purpose of calibrating the receiver to the dial. But carefully moving the plates, excellent calibration can be achieved.

It requires a bit of logic and patience. Find out the frequency range of the vfo (not the output frequency). The simples approach is to put a frequency counter on the output. Then, note the calibrated frequency to the actual frequency. Let is say at the 100 kHz range, the dial reads 100, but the actual frequency is 103. That means the vfo is 3 kHz high, which means not sufficient capacitance at that point. I would draw a correction graph for the entire range.

You know that at 100, you need more capacitance, bend the plate in a bit at that point where the rotor is just meshing with the stator. A little bit at a time.

Note that not all capacitor plates are designed to be bent like that. Generally, the high precision variable capacitors are not designed to be adjusted by moving the plates.

It is 1/2 science and 1/2 art.

Once you get the hang of it, you can use a small file and file a little notch off at any point to make fine corrections. Warning, do not do this without thought first, or you will make things irreversibly worse and we will see it on eBay.

73, Colin K7FM

This is mainly for my son to learn to work on audio amplifiers. He's a budding rock star that loves the sound of a tube amp. So I'm picking up some simple test equipment for him to work with. VOM, scope, freq counter, function generator (computer based), etc.

I also have an old electronics course for him to learn. I hope that he's going to turn into a good repair tech for his equipment of choice.

I do have another scope but I would rather he use the Heathkit. When I get the time I'll tear apart the heathkit and check out that power supply or make him do it.

Go to a shop that does auto painting and bring the original. They can match
the color, and put some paint in a spray can for you, and usually at a very
reasonable price.

Colin-

"I cut it off twice and it's still too short!"

Thanks for your thoughts. It is difficult to see whether the bent plate has sections or not. The possibility of damage is the main reason I haven't already tried straightening it to see if there was any improvement.

This VFO works backwards. Zero on the dial is the high frequency end, and 250 is the low frequency end. I've gone through the alignment procedure so everything is right at the dial edges. Unfortunately the WARC bands occupy the central portion of the dial, so it would be easy to transmit outside the low end of each band.

There is an article in an ARRL QRP handbook, that mentions the HW-9 having poor dial accuracy. I'm at the point where I'll probably go ahead and carefully straighten the capacitor plate to see if it makes an improvement. If not, I'll then take the approach you suggested to re-bend the plate.

Remember, it was a relatively low cost rig. The money went into a fuller design than the HW-7 with its direct conversion receiver (that nobody seemed to like, since there were so many attempts at improving the detector section). It was no SB-101 or HW-101, that from the start was expected to have linear frequency readout. After a certain time, people got used to that, but it wasn't the norm before that. A lot of rigs didn't have particularly good dials anyway.

I now believe the bent plate was an effort to correct another problem.
Talk about a can of worms!

With the plate straightened, it was not possible to calibrate the dial
ends within the range of adjustment of the capacitor's trimmer.

Then I noticed that the capacitor plates had not been lined up with two
"guide holes" on its frame. I did that, and things got worse.

Now I find that frequency peaks at around 50 KHz on the dial.
Apparently it is going out of oscillation, or into some other mode of
oscillation, when it nears the end of rotation.

The capacitor plates are NOT shorting. The inductor's slug is in the
correct (lower) half of the coil. The next step is to verify that the
right capacitors are in the feedback voltage divider.

Another thing I may try is to replace the VFO transistor. The original
is an MPF-105. I have a couple of spares, but perhaps a higher gain
device would be better.

Been trying to get a Heath DX-60 going. Here's what she does: It loads fine to the proper grid and plate current however when the key is up the current jumps to 200 or more ma. Then when I key it, it drops back down to the nominal 120 ma. Ive checked everything but am missing something. In the grid position it shows no current except when the key is down and peaking the grids is normal. But when I switch to TRANSMIT the plate current goes to over 200 ma and stays there until I press the key to transmit; then it comes back down to normal values. I've swapped with new 6146 and checked the 6CL6s...all good. Any ideas? Tnx   Carl

Hi Carl,
The 60B uses grid block keying. As I recall there is a halfwave rectifier ckt that provides something on the order of -80VDC to cut off the final during key up. You might want to start there as it sounds like that supply is not working.

Bob

Hi,

Did you check the neutralization? If the 6146 is taking off on some frequency way out of band, the plate current will be high. When key down, the excitation at the normal frequency captures the 6146's operation, back to normal plate current.

Have you tried keying the rig while in a.m. position?
That will reduce the screen voltage of the 6146,
reducing the input, and reducing the output to around 10W.
That won't solve your neutralization problem,
but it should keep the 6146
from being ruined with excessive plate dissipation.
If you try this, don't forget to first unplug the mic.

I had several 6146's which had fairly high key-up plate current,
about 40mA, just due to variations of the 6146 production lines.
They all tested good in a TV-7 tube tester,
but some 6146's required quite a bit more
negative grid voltage to reach cut off than the DX-60 provided.
I just couldn't use those particular tubes in the DX-60.

If you use a DMM to check the negative supply in the DX-60 (which feeds the neon PWR light), you should also check the negative supply voltage with the DMM set to a.c. volts. If the negative supply electrolytics are dried out, you will get a big ripple, and a lower average d.c. voltage output.
(This could explain why the 6146 isn't cut off in key up, since the negative supply is the source of the grid-block keying).

Many DMM's will fool you
on d.c. volts when checking a d.c. supply with bad hum, and read as if the d.c. voltage is unchanged from what it should be.
The a.c. volt DMM reading (should be only a few volts) will prove that the negative supply electrolytics are OK.

73,
Ed Knobloch

FS: A CLASSIC! An EXCELLENT HALLICRAFTERS LINEAR HT-41 amp using two grounded-grid 7094 class-B tubes. Provides 1200w SSB, 900w CW/FM and 300w AM Input. Only 20-60 watts drive into a broadband input. Full-wave rectifier. Covers 80, 40, 20, 15 and full 10 M. Great SSB output due to robust PS. 21.5" w X 19" deep X 12.125" high. Pi-section output, metered. Operates on 117VAC, Wt is 85 pounds. This amplifier has been completely gone through by R.L. Howard. It has new computer grade caps in the Power Supply, NOS RCA 7094 Tubes, Solid State Rectifiers to replace the 866As. It has a a box fan to replace the open fan and produces more cooling for the finals. Comes with original manual. This amp is being offered as a picked up only at my home in Abilene, Texas or I can take it to HamCom in Dallas. SALE PRICE: $675. Pictures available. Thanks,
Charlie Hugg, K5MBX

I had considered that in passing, but wasn't aware they could put it
in a spray can I could use myself. Instead, thought I'd have to take
the parts in for them to spray. I'll check into it. Thanks for the
suggestion, Scott.

Does anyone have a copy of the color code used on inductors in the 40s and 50s? I've got a choke that has a green body, first band orange, second band violet and tolerance band silver. Somewhere around here I have a copy of it but I am hard pressed to find it even though I've torn my library apart. I know it is consistent with the old RMA color code for capacitors but not sure of the nuances.

Thanks.

I would like to see the original speaker accompanying the RCA AR88 or CR88 receivers.

I have spent plenty of time on google with no success.

Would any one be able to suggest me where I could see a picture of it?

Could it be 0.37 uh? That would be using the silver as a multiplier.
Don't know if the body color plays a role here. Seems like most all of
my 60s era chokes have a green body.

Hi Fred:

It sounds like you have become one of us, and you have one of those rigs that things get worse and worse, instead of better and better, the more you work on the problem.

One common alignment technique is to align somewhat inside of each dial end. That will often give you a better overall alignment. Heath may not have specified that technique, in an attempt to keep you in the band. But, you should not trust the dial calibration when you get near band edge (and what used to be a pink ticket).

Oscillators go out of oscillation for a reason. It can be that the frequency limit of the transistor (or other component) has been reached. That usually does not apply to a solid state circuit that has been working fine for decades, although it can happen with tubes. It can be a change in feedback. If it occurs just after you made some mechanical changes in the capacitor (or any other component), take a hard look at that component. In the case of the variable capacitor, the capacitor depends upon one or more wipers making good contact. If they do not make a good contact, the capacitor will not be doing its job. Oscillations can either change frequency or stop.

The good news is that when you are able to correct the problem, there is a great deal of satisfaction. Sometimes, you can do it better than the original design team (which included the bean counters, of course).

73, Colin K7FM

Colin-

I hadn't considered exactly that. I did try aligning at the 50 and 200 KHz points, but the trimmer capacitor got too loose. I might try alignment just outside the dial ends, perhaps aligning zero for 10 KHz and 250 for 240 KHz.

My problem of the oscillator stopping may have been a case of overdriving the counter. Trying a different counter with an attenuator, seems to have cleared up that problem. It is a good thing I tried that before changing any parts.

Now, with the capacitor plate straightened and VFO aligned at zero and 250, the middle of the dial is off about 9 KHz. This may be a KHz better than before. Maybe the capacitor plate was bent in the wrong direction? I think I'll just leave well enough alone!

But true experience comes from reaching the point that you have gone too far, stopping just before it and figuring out another way to do it.

For example, noting the correct calibration, removing the dial face, scanning it into a computer and fixing it with photoshop.

In the old days, it would be done with a grease pencil, later a felt tip marker, and for the really precise dry-rub lettering. Now you can do most of the work on the computer.

Geoff.

No, no, no. That's too fancy.

In the old days, you'd get some graph paper, and make a chart to go with
the rig.

Bill-

That part of the dial is relatively accurate. The problem is more serious in the WARC bands, where the dial is close to 10 KHz off.

If the dial is adjusted for 100 KHz to be accurate, the 30 Meter band will be accurate at the low end. If the dial is set to anything below 100 KHz, the actual frequency would be higher than indicated, therefore inside each non-WARC band.

The only problem then is the 12 Meter band. At 24.890 MHz, the dial would ideally be set to 140 KHz. I'll have to check to see what the actual frequency is there, when the dial is calibrated at 100 KHz. It may be that calibrating at 140 KHz will take care of all bottom-of-the-band cases.

I'm having some difficulty locating a good 2Meg pot for my reciever -
the power switch section is bad. Is there somebody out there that had
one (even with a bad pot section) they can spare?

Aha...   This is NOT an S-38B, its an S-38. The S-38
has an adjustable BFO, none of the later versions do. No
wonder the schematics seemed wrong, they _were_.

I opened my S-38 to double check and the wire you
indicate in the photo is NOT there so this was definitely
someone's add on. It would be interesing to trace this out
and try to figure out what they thought they were doing.

I have to get at my RX soon, needs a cleaning and some
new caps.
BTW does anyone know of a source for Hallicrafters
knobs of the right vintage for this RX and the S-40 series,
etc? I've had no success at all in trying to find any.

Try Larry Bordonaro. I got some for my S-40A from him but that has been
several years ago.

Contact info can be found at: http://www.antiqueradioknobs.com/

Anybody notice any audio-video sync problems in the MP4
version? I tried two different players and the track was
way off.

I'm going to download the MPeg2 version and see how that plays...

Jim

How can you tell? From what I remembered and a quick review, the only place there could be synchronized sound is at the begining with the ham who was later identifed as the chief engineer of Halicrafters (Samuelson) "on the air" and the speech at the end of the second part by the head of the Signal Corps.

They were both fine with my playing them using QuickTime player and VLC under MacOS.

Geoff.

I have for sale a brand new in the box Heil PR-40 pro series microphone with a Kenwood Cable and Hand Push To Talk Cable. Also included is the larger heavy standard mic stand. All equipment is brand new. I purchased it for my Kenwood TS-2000 but sold it before I used the mic. I can send pictures. Price for all is $285 plus shipping. Thanks, Charlie Hugg, K5MBX

I have for sale a Heil HM-10 Dual element(HC4&HC5)microphone with a Kenwood Cable and a standard mic stand. All equipment is in nice condition and works well. There is a small wear mark in the paint at the top of the mic near the switch. I purchased it for my Kenwood TS-2000 but have sold it. I can send pictures. Price for all is $85 plus shipping. Thanks, Charlie Hugg, K5MBX

FS: An as new Bird 43 wattmeter with original manual(SN 995XX). It is spotless and works great. It includes 6 of the most popular slugs(100H, 250H, 1000H, 2500H, 100C, and 100D). The slugs are also in as new condition. Some of them are still in their plastic containers. This meter and the 6 elements are from an estate and were only used a few times. I want $575 shipped in CONUS for the package. I can send pictures if your interested. Thanks, Charlie Hugg, K5MBX

I have an Aerotron radio receiver here, with a slide rule dial that covers the whole 108-136 civilian aviation band. It has a switch on the back marked "6V-12V" and a cord with an 8-pin Jones connector on the end.

From a rough look of the electronics, it's probably either intended for use with a transmitter that has an internal power supply or it has an external box with a vibrator in it. There's nothing on the chassis to actually provide B+.

There's a nice looking McCoy mechanical filter in there, and the tube complement includes a 6BS8, a 6BN8, a 6CL8, five 6BA6es, and a 12AT7. Also a 0A2 for B+ regulation. Looks like audio output is line level from that 12AT7 so there's an external amplifier somewhere too.

The back of the chassis is stamped 513456 which I take to be a serial number. Any idea what model receiver this is and if it's part of a larger airborne civilian T/R set? Anyone maybe have a schematic? A google search turns up only modern Aerotron gear.

Didn't Aerotron own Gonset at one point- try looking through the Gonset models. I know they made a similar RX that was 110VAC powered.

Hello. I've been restoring a Hammarlund HQ-145 that has been neglected for many years. After performing the RF alignment, I noticed that the sensitivity at 10 Mc on the 10-30 Mc range is about 10 dB worse than when tuned to 10 Mc on the 4-10 Mc range. This was even after adjusting the 10-30 Mc ANT and RF coils as instructed by the manual.

The sensitivity is actually much better at 30 Mc than it is at 10 Mc on that band setting. I wonder if this was a design compromise? Or is there still something flaky with my HQ-145?

I would appreciate it if someone else with a working HQ-145 would please check whether theirs operates the same way. Just tune into WWV at 10 Mc on both band settings and see if there's much difference in signal strength. Thanks!

Tnx,
Joe K9LY

Worse here on a working 145A. WWV 20-40db over 9 on the 4-10 range.
S3-S5 on the 10-30 range. Seems more sensitive at 30Mc than 10Mc here
too. However, I can't vouch for the alignment that a friend did 6 years
ago for me.

Please keep us posted.

Best,
Mike KM6WB

This is typical of many receivers. It is generally caused by variations in local oscillator injection to the mixer. As you change the amount of capacitance with the tuning capacitor, you change the amount of feedback in the oscillator. Most oscillator circuits suffer from this.

You are correct about the injection, but the HQ-145 did not suffer
from this, at least mine did not. Check the Oscillator injection -
you will probably find that it is down due to a bad component. Either
the tube is weak or you have a bad bypass cap. Also check the values
of all of the resistors with a meter.

My restored and aligned HQ-160 shows the same sort of difference on
the two bands. IIRC, the oscillator injection was similar on both
bands. Sounds like this is a generic problem with Hammarlunds of this
vintage.

Neil S.

Great answers, everyone. Thank you very much for all the input. I will probably spend more time on it this weekend, and will report my findings here.

Tnx & 73,
Joe K9LY

FS: Drake 2B Receiver. Covers 80-10 plus shortwave bands with optional crystals, not provided. Outer cabinet is in good condition. Front panel is good. There is some flaking of the letters on a couple of the switches. The chassis is dusty. It has some corrosion in the copper, but not bad. The receiver works but will probably need an alignment. It has not been used in a long time. Sensitivity seems lower on the higher bands. I will supply a copy of manual. Price is $150 plus shipping from 79602. Digital pictures are available. Thanks, Charlie Hugg, K5MBX

ON the Riders schematic V5 cathode resistor is (270 ohms V5 R22).
http://www.nostalgiaair.org/Resources/922/M0008922.htm

The radio chassis on the bench has a 1000 ohm.

The Sams on BAMA has 1000 ohm on the 2nd IF cathode (V6 R31).
http://bama.edebris.com/manuals/hallicra/sx71sams/

When (Run? or serial number?) was the change and why did they do it?

Thanks,

Paul P.

Hi Joe. My HQ-145 exhibits a very slight difference between the 10 Mcs sensitivity on the 4-10 vs 10-30 Mcs bands. I spent a lot of time reworking it last year and am very pleased with the result. Remember that the 10-30 band is double conversion an you should pay a lot of attention to the adjustment of the 3035 Kc circuit. I ended up replacing T5 in mine because someone had tried to repair the original and flowed some solder on the bottom coil.

73 & Gud Luck!
K3PID

Hi, I have an IO-4555 Heathkit O-Scope that started spewing out smoke
15 seconds after turning it on.

Would like to find someone that can shoot me a PDF of the assembly
manual with schematics. The operations manual would be nice also.

I've checked Google and Dogpile for variations and can only find a
schematic for the dual trace version. (IO-4550)

A few places are selling the manuals for a goofy amount of money. I
may have some files, templates, webspace, etc. that I can offer for
trade.

One of two things happened. Either an electrolytic cap failed, or the power transformer failed. The power transformers on these were very cheaply made, and the high voltage winding had a bad tendency to short to the case. If it made a loud snapping sound, it was probably the transformer. If it made a smell that was more sharp and chemical than ordinary burning, it was probably a cap.

>Would like to find someone that can shoot me a PDF of the assembly

That'll probably be sufficient since the supply is more or less the same and it's a power supply problem you've encountered. You may also look on BAMA.

You should not need the manual. Find the high voltage winding that generates the anode voltage for the CRT.... measure resistance to ground and you should see at least hundreds of ohms across the winding. Then look at the supply caps.

You can also try powering it up with the case off and seeing what smokes.

If the transformer is good, it's worth it to replace the caps. If the transformer has failed, scrap it for parts and get another scope.

I've just got one of these by chance, in fairly good conditions and
working. It was unknown to me.
Can anybody point me to any sources of info, or does anybody have any
knowledge or opinion on this set? What class of receivers is it
comparable with? There is not so much on the web.
Thanks,
Antonio I8IOV

Thanks for the trouble shooting tips. The smell and color reminded me
more of frying resistors :-) I haven't opened her up yet to peek at
the damage.

Sure does look like a letterhead although letterheads usually also have phone numbers and cable addresses on them. There is a copyright notice below the word "radio" indicating 1945 and the pictures feature the mobile radio station from the movie (forgot the SCR number) with an E for

Efficiency banner, also the SX-28, probably the best known H
product of the time.
     I wonder what the original source was.

rec.radio.amateur.boatanchors:2448

Perhaps you've heard of the Colorburst Club, that elite band of 80M
hams that hang out around the colorburst frequency using homebrew rigs
and crystals scrapped from old TV sets.

Now is your chance to become a part of a group so much more restricted
that perhaps you've never heard of it before. You see, 14.31818 is
a standard microprocessor clock frequency, and consequently there are
surplus crystals available for it, right in the middle of the soon to
be active twenty-meter amateur band. And you can join the specialized
and esoteric bunch who hang out there.

All you need to do is send me $1 for your pair of 14.31818 MHz crystals,
and you can do with them what you like. You can use them in your own
homebrew QRP rig, or in an exciter driving a commercial transmitter to
the legal limit. There's no end to the fun you can have when you have
the power and the glory of being able to hang out with the best of the

best on 14.31818. These crystals are made of genuine quartz, carefully A-T cut by anonymous and unknown craftsmen in a distant land, and then lapped to frequency with actual abrasives. You can use them to talk anywhere in the world.

Once you're on 14.31818 you'll be one of a tight group of people so secret that nobody knows who they are. Other clubs issue certificates of membership, but the 14.31818 club is SO SECRET that we won't give it away that you're a member by issuing a certificate. Only you will know for sure that you have the honor of being a member.

Is this whole thing actually a ploy for me to unload a lot of surplus microprocessor crystals? Of course. My wife is threatening to throw them out if I don't get them out of the living room. But that in no way diminishes the importance of this club. So don't delay, send your money now.

Pull the case open and look inside! If you see some big resistors in
the power supply gone open, check the capacitors downstream of them for
a dead short. You'll never know until you open it! They are fun and
easy to work on... everything is laid out very openly and the basic
design you can figure out by looking for the most part.

This is clearly an illegal CB amplifier. The idiot was stupid enough to provide pictures which clearly showed that the back panel had printed on it: 25 to 40 MHz amplifier. Quoting FCC rules:

47 C.F.R. � 2.815   External radio frequency power amplifiers.
(b) After April 27, 1978, no person shall manufacture, sell or lease, offer for sale or lease (including advertising for sale or lease), or import, ship, or distribute for the purpose of selling or leasing or offering for sale or lease, any external radio frequency power amplifier or amplifier kit capable of operation on any frequency or frequencies between 24 and 35 MHz.

If you want a vintage scope get a Tek, since the toob models have
excellent parts availability since no revenue users want them. The
Heathkit trafo could be rewound if you really want an educational
project, but most were not very good scopes except for X-Y use. In the
SSTV days they were ham-popular since they used a commodity jug that
could be had with a P7 phosphor. that also makes a great audio level
indicator if you're too cheap to buy a Dorrough.

Hello,

Is this still available?  If so I am interested in it.

Thanks.

Hmm... that's an interesting legal point, as this device was manufactured
before that law came into effect. It is in fact, a VINTAGE illegal CB
amplifier.

I know this particular model pretty well because I once had to track down
a spur at some wierd VHF frequency that was the result of the finals
going into oscillation and causing interference with a broadcast auxiliary
channel that a cutstomer of mine was using for remote pick-up.

I have for sale 4 old stock American made 811A tubes. Three of them are RCA
and one is GE. They are in boxes and look
new. One may have some slight used. All check very good. Price for all 4 is
$90 plus actual shipping costs. I also have three
used but good 811A tubes. Two are GE and one is Electronic Enterprises. All
3 check good. Price for these 3 tubes is
$40 plus shipping from 79602. Thanks, Charlie Hugg, K5MBX CCA 307

A morale booster for Halicrafters employees. A gift from the Signal Corps.
Nothing like a patriotic mission critical project to make everyone sit up
straighter.

Its a shame that morale is so thwarted these days in the name of "tolerance"
for all that is self destructive. Sure, people did bad things in the day,
but at least they didn't promote it in the media. Remember the "Joe Camel"
debacle, where it was finally considered that we shouldn't promote smoking
with cute cartoon characters. Now go look at the prime-time cartoons and
see what they are promoting. Their motto seems to be "do everything that
isn't specifically prohibited by the fine print of the law", "good taste be
damned above all". Flakes like that should be tarred and feathered and run
out of town before someone thinks to pass a law against "everything not
specifically allowed by law".

I wonder if the military sent the films out to amateur radio clubs as
well?  It'd be a good recruitment tool both for the signal corps and for
various manufacturers looking for skilled hands.

I looked at the film again and see what you mean by the dollies, etc. I didn't realize the first time how much hand work was done. I didn't see a single power tool of any sort, the closest was a "Yankee" screwdriver. Undoubtedly there were power tools elsewhere but they didn't seem to be used for assembly.

BTW, the ham radio scene near the opening is one of the few representations of ham radio on film that is not laughable. I did notice the absense of a clock, the fellow checks the time on his watch. Perhaps deliberately so that there would be no problems with the clock jumping around between shots.

Jam Handy Films, who made this epic, was based in Detroit and produced a lot of industrials for General Motors, particularly the Chevrolet division, some of which are on this site.

They did all right, except when they tried to emulate Hollywood, as in the montage at the end of this film.

Well, I am old enough to remember when Lp's came out. They chased 78's out of the record stores in nothing flat. The 45 is an interesting case. It was much better engineered than the Lp. The speed was chosen to be optimum for for the inner and outer groove diameter, which is not the case for a 12" Lp. RCA also designed a innovative changer mechanism for it, using a one inch center hole that was much less prone to wear than the 1/4" (approximately) hole in the Lp or 78s. This also allowed the use of a simple dropping mechanism in the changer. The groove area is depressed so that the record is supported by the label area and a rim at the outside to prevent groove damage from records sliding or rotating over each other. I've forgotten the maximum time possible on a 45 but its considerable, probably around six minutes if not cut too hot. The audio quality of early 45's were better than early Lp's partly due to the higher groove velocity but also because RCA chose a different groove shape and there were some other differences.

Columbia probably developed the Lp from its use of broadcast type transcriptions to make masters for records. I am not sure of the date this started but I think it was probably around 1938. The use of a 16", 33-1/3 disc allowed more flexibility in the recording session than cutting directly to a wax master. Columbia (whoever they are now) has released many CD's transferred from these discs. In a few cases I hear faults that I thought were in the 78's. Many early RCA and Victor records have been re-released from transfers made from the stored metal work. The quality is quite astonishing, generally better than the Columbia transcriptions. Perhaps they just aged better. Its interesting to me that we can hear quality in many of these early recordings that hasn't been heard since they were recorded (on the monitor speakers) if even then.

Anyway, this is all pretty far from boat anchor stuff, although the disc recording equipment certainly fulfilled the requirements for being boat anchors!

BTW, I knew John Eargle quite well and saw him last only a few days before he died.

This is not the tool for reforming lytics. A bench HV supply with a limiting resistor or a homemade transformer rectifier and light bulb current limiter (and the resistor) work MUCH better. The Z Meter is good for finding bad large value LV lytics and RF coils in switcher supplies, but NOT HV lytics, HV mica or oil caps or big iron core inductors. Like most Sencore pieces it is fairly cheaply built and optimized for TV/VCR guys.

Hi Richard,

I did try to ID the W9WZE operator in the clip - it's not Bill Halligan - any ideas? One suggestion I had was that he was one of the senior engineers working for the company. I didn't notice any date on the captions, so if that is a post-1941 film then the operating session would have surely been staged, as Ham Radio had shut down, so maybe it was done by using recordings of the other stations?

Yes, no power tools then, but I did like the fact that all the ladies working on the line had their own named tray of tools. I wonder how many of them are still alive? They produced nearly 15000 SCR-299, 399 and 499 variants during WWII and I'd bet there are a fair percentage of those still around across the world.

Although the ham at the other end called him Bill, if you say it was not Halligan, I'll take your word for it. A little later in the film he and another man are identified as Bill Halligan and someone else, whose name I did not catch.

I assume if you actualy know what Halligan looked like (I don't) you can tell them apart and if you are careful at listening for names, you can figure it out.

BTW, did anyone notice the one serious flaw in their design? It was designed according to the film to work using standard 117 volt household electricity. A gasoline generator was included as an addon (a trailer) that provided it.

AFAIK they were never used in combat in a place that had 117 volt AC power.

I know that Europe had 220 or 240 volt power, what did the pacific areas have?

Geoff.

Hi Geoff,

The guy with the glasses in the scene in the office is Halligan, that's where they are looking at the drawings and also inside the RF deck. The other chap in the ham station part looks different. I suppose it didn't matter if it was a staged scene.

I suppose that during training in the US there might have been times when domestic 117 V AC was available but in the Pacific they probably used domestic power supplies of the colonial power, so British standard for Australia, Malaya and the British-administered islands, Dutch for what we now call Indonesia and possibly US standard for the Philippines? In Europe 220-240 60Hz is the standard now but I don't know about WWII, the UK still had areas using 220 V DC at that time.

There's an interesting article on the SCR-399 in Russian service here -
http://www.w9wze.net/df.php?dn=Features/Hallicrafters_in_WWII/Marshall_Zhukov.wp

Cheers,

Roger/G3VKM

If you're invading, you get to say what standard power is.

They may well have sent the thing out with a set of adapters (or just
taps on the mains transformers) for times when reliable power was
available.

I came across one of these panadaptors. Its almost identical
to the Army version (BC-1032 ?), but this one has an IF

of 400 KC +/- 50KC. Does anyone have any idea what
receiver(s) it was used with? I'll probably try to convert
it to a 455KC IF so its usuable with receivers I have, but
before doing that I'd like to get some more info about it.
TIA.
Steve

The ham radio session was almost certainly staged. Old
call books would identify the station. I wonder if any
library has a collection of them, perhaps the ARRL does.

Bill Halligan is the fellow behind the desk in the scene where the modifications to the HT-4 are being discussed.

I was wondering how many of these rigs were made, where did you get the statistics?

I think you mean 50hz. Power standards have varied all over the place and are still not uniform. In 1944, for instance, Los Angeles had both 50hz and 60hz power. A few areas had DC power (parts of New York City for instance). Canada around Niagra Falls had 25hz power (made the lights flicker). In the US standard mains voltages were 110, 115, 117, 120, 125V,220, single phase AC and similar voltages for DC. There was also three-phase AC at 220, 440, 480, and some other voltages depending on where you were. Much military equipment was usually designed with transformers which could operate from either a nominal 115 or 220 V and could operate on 50hz as well as 60hz current. Some equipment, like the BC-779 receiver (Hammarlund Super-Pro) were available with power supplies that could run on 25hz as well as 50/60hz at perhaps a dozen voltages.

Undoubedly the BC-60 could run on several voltages and on 50hz current but the rigs shown in the film are self-contained meant to operate from the generator sets supplied.

FWIW, Bill Halligan was W9AC

Hi Richard,

The topic of BC-610 numbers came up on the WS19 group on Yahoo recently and someone supplied the following:-

"During the period 1 Jan. 1940 through 31 December 1945 the US Government purchased 14,706 of the SCR-299, 399 and 499 sets.

Practically speaking, deliveries did not start until 1942, when 1571 sets were delivered. In 1943, 5,911 were delivered, in 1944 another 5,317 sets, and in 1945: 1,907. This does not count the HT-4 versions delivered for testing before the creation of the BC-610, and I believe there were sets purchased and delivered after 1945 as well, for use in assorted AN/MRC- numbered communications vans, up through the Korean War period.

I don't know whether there were any lend-lease contracts for these sets. If there were, those numbers probably would not be included in the above".

Can't recall who posted that but it was someone in the US.

Hallicrafters also re-badged the BC-610 as the HT-4 after WWII, probably to clear stocks, I have a manual for one. By the time the Korean War came along, dealers over here were offering good prices to buy back '610s and ET4336s that had been sold to the ham market, in order to resell to the military - two bites of the cherry.

Roger Basford

I'm going a vague memory here, but one of the fellows did look like
Bill Halligan who 10 years later was often pictured in Hallicrafter's
ads.  I remember he had a two letter suffix in his call and for some
reason I thought it was  W9AN. Someone with a 1950's QST might be able
to see the ads. I believe that Bill Halligan is the fellow who appears
```

at minute 5:30 or so of part one of the film and I think he is the fellow on the left with the rimless glasses. Notice how spartan his executive office is. Two letter suffixes were extremely rare in those days. You had to be licensed before WW I to get one. There was no country prefix at the start. I had two mentors in the mid 50's when I was a young teen with my first license. They told me that right after WW 1 their calls were 9GI and 9AOF. The guy with the two lettter suffix got his before the war, the guy with the three letter suffix got his immediatiately after WW I and always thought he should have had a two letter suffix. W9GI was the only two letter suffix in our town. He was an old marine telegrapher on the Great Lakes ore carriers and car ferries. The "W" was added later to US calls (and the "K's" came in the 50's ...I was first K9CAH in 1956 and callsigns were done in alphabetic order at that time. "N" and "A" suffixes came later.

Of course, the scene with the ham operating at the beginning had to have been a simulation as there was no ham radio during WW II, the hams were forced off the air. The same thing happened in WW I.

I doubt anyone with an original two letter suffix is alive anymore. The few I knew then were very old men in the 50's/60's. Those with two letter suffixes who have them now started to get them in the mid-late 1970s. At first you could get one if you held an Amateur Extra and had been licensed for 20 years. The first group to get the two letter option at that time were those who held the Extra before incentive licensing came to be in the late 60's (they were very few in number) Then it got phased in by according to when you got your Extra and had the 20 years in. I was in that 2nd batch. Later the whole thing became a part of a "vanity" callsign program. I got my two letter suffix in 1977 right after I crossed the 20 year mark (I was licensed at age 13.) To the extent they were available you could request a callsign. I got my own initials though that call was actually my third choice.

My first radio was a Hallicrafters S-38D which my folks bought for me (rather cluelessly) while I was awaiting my license (It took about 3-4 months for a license to come through after one took an exam back then,) The S-38 family was really just a consumer shortwave listening radio and I'd be hard pressed to think of a radio less suitable for two way communcations. Nevertheless, I did muddle through for one year with that radio for a year and probably developed great skill in selective listening to sort out signals on the novice bands which were very crowded then. I worked quite a bit of stateside stations, probably 20 states with that receiver and a heath AT-1 trasmitter, rated at 25 watts INPUT, but actually putting out only about 7 watts. We were QRP before there was QRP. By the next Christmas I had my General Class which was actually quite a feat for a 13 year old as the test required hand manipulation of algebraic formulae and I was a year shy of having any Algebra class. My high school shop teacher (W9ZKB -SK) tutored me through all this and I passed the first attempt. For a short while I was the youngest ham in Wisconsin. I got a Hammarlund HQ-100, one of the very first of those and had to wait about two months beyond Christmas for it to come in. I had by then a Viking

Adventurer which was 50 watts in and about 25 out. It was all CW, I couldn't afford a phone rig at home. I operated a lot from my Junior High School where W9ZKB set up a spare rig of his in his drafting classroom. He let me operate there during his class when I had a study hall but I had to operate CW since I couldn't disturb his class. With that lack of phone access, I became a pretty dedicated CW op. I still am.

HI Harold,
Yes, there is a VSB net, 14.292 or 293, 3PM ET Sun. You probably have trouble hearing the regular net control, K5LYN, in TX. Several of us do take checkins during the hour in case he can't be heard. I (W8UT) usually take a few minutes, W7OA, Tom, in Reno, an WB4BPS, Vince, in AL do also, and sometimes others. We hope to hear you some week, hang in there a while. Propagation's been crappy (technical word there) for a long time, maybe it'll get better sometime.
73,
Al, W8UT
(see you at Shelby in a few mo.s, think I missed you last yr)

The SCR-299/399 were designed to run off 110VAC 60Hz. The PE-95 gas
generator is a 10KW 110v-only unit. I, personally, have never seen a
BC-610 running off 220v. In past discussions with my my Elmer, he
explained that they had SCR-399's on Guam and Saipan and they all ran
off either the PE-95 or "base power" which was 110v 60Hz. Although not
a ham, he was the OIC of the Signal Detachment. Whether the '610 or the
'299/'399 will actually run off 50HZ power, I do not know. The TM's
would seem to indicate not. BTW, the Signal doctrine back then was not
to plan to use, nor depend on, indigenous power sources.

AFAIK they only used the generator as it was designed as a field station. There probably was no other power where they were usually operated. Just never meant to rely on shore power. I had heard that it was thought the electrocution hazard was too great to use 220. I used to have a 1kw AM/RTTY transmitter made for a later unit that ran on 117 also. Lotsa AMPS. The 10kw generator had a 4 cyl Jeep engine.

No help at all here

Some years back, maybe 1962-1963 I substituted 6293's for 6146's, and if I recall, the desired effect was it achieve higher plate current peaks in class C, AM modulated service. Homebrew rig was attempting to use negative peak clipping.......... remember when? I thought it worked quite well, but never did have the resources to try the same circuits with 6146's. Those were the days where anything worked with spectacular results on 10 or 15 meters. Europe, Asia, Orient, South Pacific were all easy ones at their time of the day!!

It will reform caps but to what voltage?? And it's a very expensive
way to reform caps when all you need is a DC bench supply, commercial
or homebrew. The supply does not need to be regulated or quiet and may
put out almost no current.

Also to reform lytics you want to warm them up to a higher
temperature. So add on a heat lamp or a box with a light bulb in it.

Hi,

I, and a couple of other British BC-610 owners run our TXs from 50Hz mains, in my case the domestic 230 V is stepped down to 110V using what is called a "site transformer" - designed for outdoor power tools. The only drawback I have noticed is the occasional loud rattling from the antenna relay when it is powered-up, presumably its AC solenoid coil prefers 60Hz. Running the whole TX off 220V would mean a swap of all power transformers and mains-powered relays in the equipment, so IMHO it's much better to use a step-down transformer of some sort to do the job and give additional shock protection.

I have 2 LC77s and they *will* reform lytics up to 1000vdc. Its just a
PITA beacause you have to use the handle to hold the little plunger
thing against the "leakage" button.

```
***DO NOT*** heat up caps *while reforming*. Its fine to heat them
before to rejuvinate the electrolyte, but let them cool to room temp
before attempting to reform.

If you go onto an American military base in Germany today, you'll still
see Edison outlets at 110V.  Americans have always carried our power with
us wherever we have gone.

What He Said, regarding bases in ROK, RVN, Thailand, Japan, and other
places I was stationed. We USAF types always take at least one Power
Production type and something to generate 117 (or so) VAC or "220"
(usually 230-240 VAC) at 60 Hz, unless we're out in the boonies and
running off batteries. For the heavy-duty stuff, we always had 480 VAC
3-phase (wye or delta, depending) at 60-Hz.

--
It typically takes 25-30 gallons of petrol/diesel to fully-consume an
average-sized body under ideal conditions. That I am conversant with
this level of detail should serve as an indication of why the wise man
does not ask me questions about MS-Windows.   --Tanuki the Raccoon-dog

JP <JP@AskMeForRealEmailAddy.com> wrote:
>According to the manual it reforms caps.That's my best answer.So where
>is the drawing ro schematic of what you are talking about since I am
>selling this one?

It does, but it's not a really good way to reform caps.

Here is a schematic, though you must have a fixed-width font to see it:

```
  +-----)(--------+
  |   YOUR CAP    |
  |               |
  |      o--------)-------+
  |     / \       |       |
  +--o/+   -\o----+       |
      \     /             |
        \ /   1kv bridge  |
         o                >   1K ohm
         |                <   or more
         |                <    1W or so
         |    115vac .2a  |
         +uuuuuuuuuuuuuuuu+
         ==================
            +mmmmmmmmmmmmm+-----------------/ |=
            |                 on off       (  |
            +-------------------o/ o--------\_l=  117vac
```

The transformer output should be maybe half to 3/4 the rated voltage on the capacitor. This is really just the front end of a power supply with an enormously high value current limiting resistor so that the cap gets charged up much more slowly than it normally would in a power supply application.

You can put a load shunt resistor across the cap if you want it to charge up even more slowly and if you want to reduce the maximum voltage it charges up to.

You can alternatively take the attitude that if a cap needs to be reformed it should probably be replaced instead.

Note that most of those construction site transformers are actually
autotransformers and don't give any real isolation. But it's true that
a shock at 110V is less nasty than a shock at 220V.

I'd tend to suggest real isolation transformers with electrostatic
shielding, if only because it prevents RF from getting onto your power
line grounding system and causing interference issues and a changed
antenna pattern.

But in the summer of 1944, you would not have found any (110 volt
power or US bases) in Europe. The whole point of the unit was to be
a portable radio station, not something you had to build a base around.

The cost of a "universal" power supply would not have been that
much higher.

Geoff.

I thought France was still on 110 in those days. I've restored some
French sets both pre and post war, some I think were 110 only.

Sure you would have! Wherever you have an SCR-299, a tent, and an
infantryman, there you have a military base.

>The cost of a "universal" power supply would not have been that

True, but not all that useful if you're carrying around a generator
anyway.

France was spotty, with some places being 110 and other places being 220
and a few places having weird line frequencies too.  This led to a legacy
of lots of weird incompatible light bulb bases too, which the EU is only
finally getting cleaned up.

Remember, this was an era when there were no large scale power grids,
and individual cities had their own generating plant and their own
standards.  Well, Germany started to have a grid, but we took it out....

FWIW, the third edition of _Reference Data for Radio Engineers_ dated 1949 shows France has having DC power at 110, 120, 125, 220 volts and AC at 110, 115, 120, 125, 220, 230 volts and both 50hz and 25hz. It indicates that the predominant power was 110 or 115 VAC at 50hz.

A this time power frequencies of 25hz, 40hz, 42hz, 43hz, 45hz, 100hz (Malta) could be found in various parts of the world.

50hz has always been the most common power frequency in Europe and 60Hz in the USA and Canada. 25hz is used for industrial purposes, particularly for electric railways because core losses are lower in motors and transformers (less heat dissipated). I have no idea of the origin of the 40hz series. Power voltages and frequencies in "third world" countries usually follows the preferences of the countries that colonized them.

In the Los Angeles area until about the mid 1950's one could find both 50hz and 60hz power. The city, which is supplied by the publicly owned Department of Water and Power was 60Hz, the outlying areas not incorporated into the city mostly got their power from Southern California Edision which was mostly 50Hz. I remember seeing hydro-electric generators at the old St. Francis power station that were originally 50Hz but were run overspeed to generate 60hz. These survived the St. Francis dam collapse and subsequent flood.

Richard,

I believe the real reason for 25 Hz power near Niagara Falls was the large number of chlor-alkali plants in the area. The Castner Electrolytic Alkali Company began operation at Niagara Falls in

1897. Eventually this became the Olin Niachlor plant. Chlor-alkali plants are a major consumer of electricity, and it was plentiful and cheap at Niagara Falls. Other companies in the same area with chlor-alkali plants are DuPont and Hooker (later to be Occidental Chemical).

The reason for using 25 Hz AC is related to the need for high current DC for use in the process. In the early days, mechanical (rotary) rectifiers were used to convert the AC to DC. Essentially a synchronous motor was used to turn large disks broken into sections. AC was fed to these disks. Brushes would rub on the disk producing a unipolar output. Operating at 1500 RPM this system was quite efficient. But at 50 or 60 Hz, rotating the disks at 3000 or 3600 RPM, the efficiency was less (the off time, essentially the insulating space between the disk sections, became a larger portion of the total period) and the brushes wore out faster. Operating at lower frequencies would have been even more efficient but transformer size became excessive.

Unfortunately the early electrolytic cells used mercury for one electrode leading to a major pollution problem. You might recognize the name Hooker Chemical from their waste being dumped in the Love Canal.

```

Caps must be formed once when new and then reform themselves continually in use. Many lytics five or ten years old work great for a decade or two if properly reformed. All you need is a high value resistance in series basically.

I hate ASCII schematics but if you can't picture a standard half wave or bridge rectifier off a secondary and a resistor you are in the wrong business. I like to mount a salvage plate and filament transformer-ones out of TV shops for old color TVs, bad for audio because the B+ is too high and not enough current, are fine-in a dead PC power supply metal box with a rectifier and jacks before and after for DC or AC. You can put a filter cap inside the box after the rectifier. Use with a Variac for convenient use. Add a series socket for lightbulb current limiting and a shorting switch to taste, but always a fuse on the primary.

The RBB and RBC use 400kHz for the IF, and they had optional outputs
for a panadaptor, so I'm fairly sure they were meant for each other.

I wouldn't modify it.

Alan

You can still buy tube regen kits, for example:

  http://www.tubesandmore.com/scripts/foxweb.dll/moreinfo@d:/dfs/elevclient=
s/cemirror/ELEVATOR.FXP?item=3DK-925

It wouldn't be the same as my first Space Spanner... not unless I
could be 8 years old again!

For one thing, the neighbors all have cable TV today and so the massive RFI
won't bother them so much....

I have acquired a rather nice example of this tube-type VLF-LF receiver.
  Its all there and in excellent condition.  I need the schematic or
(imagine!) a book on the unit.  Will pay to copy whatever you might
have.  Thanks much, in advance.  de Jeep/K3HVG

Thanks Roger for that link. I wonder how he pulled off that two letter
call suffix having had a three letter one before. That must have been
quite rare or perhaps some sort of "reward" for his WW II engineering
service. I have no idea how that worked in those days. By the time I
got into radio (1956 as a teen) two letter suffixes were VERY rare in
the US until they became available as a sort of reward for having the
Extra Class and a certain amount of longevity. Later they became
available as a "vanity" program in conjuction with holding certain
classes of license.  1X2 calls don't seem to become available very
often now.

Allowing for changes in eyeglasses and a bit of aging, it does appear
that the fellow pictured in your link is the same guy I think was
Halligan in the movie.  I knew one fellow who had worked with him
during the war and he said that Bill Halligan was a real gentleman and
a brilliant engineer.

I need a new front panel for my SX-101A. Would any of the Mark
series be interchangeable (i.e. same switch positions, etc?) I'm
overly worried about having it 100% authentic, but hopefully the
shafts would line up on a different panel..

The LC53 goes to 600 volts...thanks for the advice on the heating

The manual states that the Sencore uses very low amperage to reform
caps...maybe micro amps IIRC...don't see the difference except that it
adjusts with a switchinstead of hacing to swap out components and
rebuild a power supply for each value...and has a readout to show you
when the caps is "done" ...just my 2 cents...

Sencore manual says using bridge for measuring isn't right way for DC
measurements...I am assuning they know what they are talking
about...there's a LC102 manual on BAMA...might want to check it out
just for the fun of it..

That ASCII schematic wasn't exactly a Visio either...there are digital
groups for binaries..

How come every time I post some FA that there is always some know it
all that has some shit to say about it trying to queer the sale?.if
you are not interested in buying it then just don't click please! I
get tired of that shit! I post something every so often - not a
commercial seller or anything. So just leave it alone. If someone asks
- by all means answer it with your opinion. But, according to
Sencore's manual and other sources, your bridge arraingement is not
the right shit for measuring caps in a DC circuit.The bridge is for AC
measurement..and I prefer to trust Sencore over some anon post on
USENET...

Auction and for sale are not allowed on the sci.electronis newsgroups. A seperate newsgroup was created at the same time for those listings. It is: news:misc.industry.electronics.marketplace

As far as people giving you a load of crap for ugnoring the charter for these groups? Good for them.

Keep digging a hole. The basic circuit shown is just one way to reform electrolytics. A better circuit uses a Variac before the transformer to let you set it anywhere you want it, and use a resistor to limit the current to the desired range. A mA or uA meter in series with the negative lead to monitor the current. its been done that way from the first days of manufacturing electrolytics.

BTW, have you ever USED the Sencore LCR bridge for actual work? I have. I have also used HP. The only 'feature' the Sencore meter had was the ability to measure ESR. You can buy a kit to do the same thing for about $60, or 'roll your own' for $5.

So, you think HP or Tektronix would leave a pair of clip leads powered with up to 700 VDC available for someone to get shocked? MORON.

They won't risk the liability and Sencore doesn't, either. Sencore is not laboratory grade equipment, it is made for repair work. That is a market that HP and Tektronix has almost always priced themselves out of. The Sencore equipment was designed to be carried on a service truck, or to take as baggage on a plane to the customer's site to get equipment back on line.

Oh thank you for your infinate knowledge there dumb ass...Caps are
used in two different circuits and are tested different for DC than
AC...and I am well aware that manufacturers use a bridge...so fucking
what? You have never had something to say to me other than mean
mouthed bullshit. So go back to the glory hole cafe and get lost
asshole!

No, but GenRad did.   I have a ZM-11/U around here somewhere and you can
get a pretty nasty shock off the bridge output if it's set to balance
charged caps. You can also blow up low voltage caps if you try and measure
them too, unfortunately....

Thanks Allen. A couple of others told me the same
thing. As it turns out, the guy I got the panadaptor from
has an RBB receiver, so I'll try to get it too. Ever
notice how these beasts seem to multiply?!

I did modify the panadaptor to 455KHz, but its an
easy thing to reverse. If anyone is interested, change
the 100pF caps in the first two IF cans to 82 pF
and retune them. The 'reactor' coil needs to be
retuned to sweep the new center freq of 455KHz +/-50KHz.

I vaguely remember my father (an electrician) telling me that power at the very beginning of WW II in the Gary Indiana area was 25 Hz.

Does anyone know anything about that? Would the presence of steel mills and other heavy industry have anything to do with it.

I have no reason to doubt what my father had said (but I can't ask him anymore.)

Were there other places in the US that had non standard Hz. Also I'd be interested in knowing when 60 Hz became the US standard and why?

The Gary, Hammond, East Chicago area and Southern parts of nearby Chicago is, of course, one of the more heavily industrialized areas in the US, or at least it was in the first half of the 20th century. Gary (which happens to be my birthplace though I only lived there 10 weeks, at the beginning of WW II) was founded specifically as a "Company Town" in 1906 for US Steel and is named for an early president of the company.

Jon Teske, W3JT [And as I found out on the only visit I ever made to Gary aside from bypassing it on the tollways when I stopped to get an Indiana Birth Certificate, my claim to fame is that I was born in the same hospital as the Jackson family kids...Michael, Janet, Tito etc.

Sheesh!]

How many years has General Radio been out of business? One of the
regulars on the sci.electronics.* groups was an EE there, and has told
similar stories of bad design practices.

I have for sale several antenna rotators with controllers plus other
accessories:
1. Yaesu G-400RC with copy of the manual. In very good shape and works well.
Price is $175;
2. Alliance HD-73 with manual. Looks good and work good. Price is $225.
3. Hy-Gain Ham IV with manual. Works great and in nice cosmetic condition.
Price is $275;
4. CDE Ham III. Needs lubed. Tries to turn, but can't. Break works,
Controller works. Tube of factory grease included. Price is $145;
5. CDE AR-22 light duty rotator and controller. Works good. Comes with
lower mast mounting bracket and an extra AR-22 Rotor for parts. Price is
$125;

6. Hy-Gain Tailtister lower mast mounting bracket. Very nice shape and heavy duty for big antennas. All clamps and bolts. Price $40;
7. Ham IV and lighter duty lower mast mounting bracket. All bolts and clamps. Price is $20.
Thanks, Charlie Hugg, K5MBX

hello friends.
my name is peter kuut, this is my first posting, i have many years an bc191x.
the model is a 24 volts transmitter, with a switch 24-28 volts.
on the most transmitters there is the year of built, but not on mine bc191x.
so i have some questions about mine.
when is my transmitter built
on the tranmitter i see english text, around the knobs, not france text.
is it an american transmitter (model375)
is my transmitter used at a plane ?
i hope to receive from people here some information about mine bc191x.

greetings from peter in holland.

Hi Peter,

The BC-191 was mostly used on ground radio installations but you are correct that it is similar to the BC-375, which was used in heavy aircraft. I think most BC-191 transmitters had a 12 volt power supply but as yours has a 24/28 volt supply then it could very likely have been used in an aircraft. It is an American radio, any you have seen with French markings will have been marked after building or marked as a special order for France. American aircraft like the B-17 and C-47 that carried the BC-375 where used a lot by the French Air Force after WW2.

There is a lot of information on the internet about the BC-191 and BC-375, look at http://www.dse.nl/~vrzaob/wc52/radios.htm for instance for a site in Holland. If you are not a member already, I suggest that you look at joining the Surplus Radio Society in Holland, where you will find a lot of owners of this radio, http://www.pi4srs.nl/

Good luck!

Roger Basford

Peter, The BC-191 and BC-375 were manufactured in the USA. The BC-191 was used as a ground-based radio system with the BC-312 and BC-342 receivers. The BC-375 was an aircraft transmitter used with the BC-348 receiver. I am curious, though, that your BC-191 transmitter is said to operate on 24-28 volts. Given the difficulty, principally mechanically, required in modifying this unit from 12 to 24 volts, I wonder if it is, in reality, a BC-375? There were many many BC-191 and BC-375 units available as surplus after WWII. There really would not have been the necessity to modify these units. But, anything is possible! Is the original General Electric name plate on the front panel? The BC-191 had some connections made via connectors on the bottom of the transmitter, the BC-375 did not. The BC-375 has three large connectors on the left side, the BC-191 has four. This may give you some additional clues. The 24/28 volt switch you speak of was to allow the unit to be ground or radio-shop tested using 24 volts and then switched back to 28 volts for normal aircraft use.   The radio technician could switch back and forth as needed.

For information, after WWII, many airlines tried to use the BC-375 and the ART-13. The ART-13 was infinitely more successful and was used well into the 1950's by the US military and airlines, albeit with some modifications. My particular ART-13 was used in a NASA aircraft into the 1960's, as indicated by the date on the frequency chart. It sounds as though your unit may have been obtained by either the French military or an airline and used either in aircraft or as a ground station. In the 40's and 50's, many airlines had extensive HF ground stations to be able to talk to their aircraft in flight and at long distances. Although not quite as extensive, this very much continues, today.

Regards Jeep/K3HVG

I have an absolute mint DX-100B that sat in a closet for 50 years.
There is not a scratch on it. I assume that it worked when it went
into the closet as it was hooked up to a Dowkey relay and a Heath SSB
generator. I have never powered it up. I need comittment to buy before
I carry it downstairs and lug it 864 miles to Dayton. It weighs 97
pounds. $500 John Shidler, NS5Z 318-222-5676.

I have a mint condition Grundig Type 701 GDO s/n 3023, sold here in
Australia sometime in the mid-to-late 50s by Jacoby Mitchell. Works
really well, recently used to check some IF transformers.

I'm a bit curious about how widely sold these were, how many are still
in captivity.

It is *not for sale* but I can supply a .pdf of the original (in

English) manual, if you need one.

John Mackesy VK3XAO

I am restoring now aligning a S-38. Yep, all caps and resistors replaced except the domino caps and tubes tested, bias voltages with in spec. I gave up the alignment for now. I am having trouble aligning the Band 2 at 5mc. The oscillator just dose not want to go high enough. Perhaps a good night's sleep will help.

Questions:

1) What is the oscillator offset (add or subtract the IF freq 455) for the four bands? Are any bands different from the others? Broadcast is just fine at frequency plus IF (455).

2) Are the domino caps paper inside or mica? They are NOT Micamold. There are three of four of them. I was going to replace them next and heat gun the coils.

http://www.nostalgiaair.org/PagesByModel/862/M0008862.pdf

Thanks,
Paul P

The postage stamp caps are mica but probably not silver mica.

If all the other frequencies come in the problem may be that something has shifted in the band 2 oscillator coil. Most of these coils have a couple of spaced turns to adjust the value. You will have to juggle between the coil and the trimmer.

The S-38B LO is 455 khz above the signal frequency on all bands.

The postage stamp caps are mica but probably not silver mica.

If all the other frequencies come in the problem may be that something has shifted in the band 2 oscillator coil. Most of these coils have a couple of spaced turns to adjust the value. You will have to juggle between the coil and the trimmer.

The S-38B LO is 455 khz above the signal frequency on all bands.\

Thanks Richard,

Yes the whole band is shifted. I will look at and chase the coils.

One point of clarification. So that would make 5 MHz look like 5.455MHz on the oscilator?

Does anyone have a copy of CQ magazine for November 1951 please?
The issue contains a construction article - the "Standard of Comparison" receiver.
If anyone can supply a high definition copy of this article, or know of an alternative source, I would be extremely grateful.

Theo

Exactly.

Looking at the schematic it appears that bands 1 and 2 have fixed padders in them. For Band-2 its C-11, a 2200 mmf cap and probably one of the postage stamps. If this has changed value it will throw off the band. I think this is more likely than the coil having shifted. This is a common value so a replacement should not be hard to find. I suggest changing it before doing anything else.

Trying to follow your posts across the different forums.

The 38 is a plain jane AA5 with shortwave bands, Don't try to read too much into it. Image rejection is so poor on the top band that it really makes little difference as to how you tune it. You're welcome to try, though.

      I'm glad you wrote because I mistook the band Paul was trying to
align. Its band -3 which does not have a padder. So, if nothing else
seems wrong the coil may need tweeking.
       I am pretty sure all the bands on the S-38 series tune with the
LO above the signal frequency. One can always try it below. If that's
wrong it won't track properly.
      I don't think it has any image rejection at the upper part of
the top band:-)

Richard Knoppow
WB6KBL

Gentlemen,
A point of clarification:

Band 2 is the problematic band. It covers 1.650 to 5 MHz. The 5MHz is the oscillator set point. The padder is to be set at 1.8MHz and does not even come close with the difference at the 5MHz Osc Trimmer error. This band is aligned after the 455 IF, BFO and two higher bands are aligned. After this band is the standard broadcast band.

The padder C11 on band 2 is a variable cap with a postage stamp (domino) in parallel. I disconnected this parallel cap in hopes of raising the overall oscillator frequency to align to 5MHz with no success. It barely made a difference (no big surprise here).

The other bands align properly starting with Band 4, 13.5 - 32 MHz,
band 3, 5 - 14.5 MHz and last
band 1 broadcast.

I will also check C9 (2700 or 3000pf) in series with the tuning gang on a hunch. It may have some low end affects. I did not attempt to calculate the low end cut off point (collage was too long ago).   The band spread has been set to Zero in accordance to the alignment procedure page 15-62.

I did use carbon composition resistors in front of the first IF for Rs 1, 2, 3, 20 & 21.

I will try all the suggestions today. I spoke with the owner yesterday. He wound up in the hospital with a chainsaw gouge in his leg. He and another were at our ham club cutting trees and had an accident. I want to get this chassis working great for him. Your help is helpful.

As always, thanks for all the input!

Paul P.

Are you able to get the 5Mc point set ok?

Sometimes the solution is to fudge on the dial pointer alignment and see if the other 3 bands can line up. However, if they are spot on now that might not be the direction to go.

I have done this before on other chassis. This chassis has hard stops at the dial scale extremes. Moving the pointer will throw the pointer off where it will not cover the band scale edge. This would be unacceptable on this chassis.

I can not get the 5Mc aligned. It is fairly far off uniformly across the whole band. All other bands are dead on the marks.

I am Climbing The Stairway to Heaven (the shop/shack) at this time. I will report back later.

Thanks Bill,
Paul P.

Ah, ok. Now I'm on board.
No point in fussing with the padder yet, then. Things may fall into
place once you get the top end of the band right.

Just for grins, will the oscillator tune to the lower side (4545)? I
don't *think* it should be that way but ya never know.

Any indication which aircraft? What is on the chart?

Should not have to fudge anything.  The top and bottom bands are good so the
Oscillator is good.  The 5 mc band is off so there is a bad part connected
to the band switch.  Fix or replace.  Fudging always makes more problems.

I had an S-120 growing up
http://image08.webshots.com/8/8/80/83/136388083yhLWvj_fs.jpg
and later, S-38E for show.
http://www.woulfeman.com/Radio%20Hallicrafters.jpg
I was SWL long before I got around to the ham ticket.

JB was the closest. After fussing with it for another two hours I started tracing the padders on each band. What I found was very curios.

There was a rather original looking wire connected from the band 2 osc trimmer (coil lug 20, see schematic) to one of the antenna coils (tab O on the wafer switch). Why that was put there? I have not a clue. Once I disconnected the trimmer side of the wire the oscillator snapped back into alignment range. It tweaked in at both the 5Mc and 1.8Mc alignment points dead nuts on.

I desoldered the switch side of the jumper (tab O). The joint looked rather factory and not owner installed. Curious. The Trimmer side (coil lug 20) was definitely messed with (short lead and burned insulation).

Ham owned gear. It's like a box of chocolates. Ya never know what you will find.

Thanks to all for the comments. They did help focus me on the band 2 circuit.

Paul P.

OK then I wasn't wrong about which band was the problem:-) However, in the Rider's manual from Nostalgia Radio C-11 is shown as a fixed 2200 uuf cap.

I also found a PDF of the original Hallicrafters handbook. This also shows a 2200 uuf fixed cap in the padder position. The component numbers are different from the Rider's sheets, in the Hallicrafter's book this cap is called C-16 and is listed as a 600V mica. For band-2 the only adjustment is the trimmer, C-21 (in the H book). If the low end is off or if the entire band is off I suspect C-21 or else coil damage. The S-38 does have an adjustable padder for Band-2 but the S-38A and S-38B do not. So, I suspect someone added the adjustable cap for some reason, perhaps because of the problem you are having. Anyway. I would remove it, put a 2200 uuf mica cap there and see what you get. If the thing is still off check the coils and value of the trimmer, maybe someone substituted it.

Congratulations!!! I was about to post another answer because I find that only the S-38 had a padder on this band, the S-38A and B have just the 2200 uuf fixed padder.

As you say, who knows what that person thought they were doing.

If the owner plays around with chain saws I can understand why you wanted to please him.

Yes. I should be seeing him today. He is an very active member of the Skyview Radio Society ham club. He (and others) do a lot to promote Ham Radio. He tried to talk the nurses into a VE session and getting their license.

Richard,

Where did you find that manual?

As a side note, if you look at the Nostalgia Air schematic it does show a
padder on the band 2 position and it is bolted on the chassis with access

holes from the top. Band 2 does have a 1200pf cap in parallel with the padder that is needed to align the 1.8Mc point. That cap is NOT depicted on the schematic. The padder does look factory as do the holes, wires and bolt through the chassis.

And thanks again for all the comments and help,

Thanks, Paul P.

Occasionally I find some equipment that never worked from the factory and so
escaped much wear and tear, being passed from one shelf to another.  After I
acquire it for a song, I find a quality control issue.  I got my IFR that
way.

Its on BAMA. I usually use the mirror site because its much faster most of the time. See
http://bama.edebris.com/manuals/hallicra/s38b/
There is also a Sam's folder in the same place.

I suspect Hallicrafters made a lot of undocumented changes at various times. The S-38 has a padder on the second band but it faces the bottom.

I have both an S-38 and S-38B in the hopper except the S-38B is in one of a couple of storage garages and I no longer remember where. This was my first short wave receiver bought by my parents new after a great deal of nagging. I think I have become a defacto Hallicrafters collector without meaning to.

I agree with that! I have picked up several pieces of equipment that
are 'like new'
but have some subtle problem. Usually it is a small error with large
effect on operation.
Does not say much for factory QA!!

Presume you mean an RCA signal generator type WA-44C.
If all you get on the output connector is 120 Hz hum,
that points to a bad electrolytic capacitor in the power supply.

Look for large tubular capacitors with ratings like 10uF or 20uF 250V
connected to the rectifiers.

If you put a digital multimeter across them, you should only read
a fraction of a volt on the a.c. volt scale,
and maybe 150V on the d.c. volt scale. If you read a high a.c. volt
value, the capacitor has dried out, and no longer works.
They are easy to replace.

However, I should add that the version of the HB-3 at Pete Millet's site is not complete and is in the form of a great many PDF's, essentially one for each tube he scanned. While it certainly is valuable the version at Filefactory is relatively complete and combines into a single PDF. You should check the version at Millet's site because it may have some tubes not included in the Filefactory version (see Scott Dorsey's comments above).

Hi, Tony

I divided the one large pdf file (214MB) into three RAR files
because the hosting service had a 100MB max file
size for free download.  Only about half the guys who downloaded
so far have the patience to go back for parts 2 and 3.

Maybe they don't realize that they need all 3 parts to un-RAR
(like unZip) the book.

My apologies - the file hosting service is not the best.

73,
Ed Knobloch

Ah thank you Edward, I'll try your suggestion.

Sorry about forgetting the specifics of the RCA Sine Wave generator and
sorry to Colin as well.

It's also over 3400 pages. Quite simply something that if you had to
pay $.10 a page to photocopy plus the cost of shipping, most people could
never buy.

> Only about half the guys who downloaded
> so far have the patience to go back for parts 2 and 3.

It's difficult. It took me overnight to download them because of the
limited number of simultaneous downloads and a daily download limit.

If you do download all 3 parts, keep their names unchanged and put them
in the same directory, then must unRAR programs will assemble the entire
book as one file if you extract the first file.

> Maybe they don't realize that they need all 3 parts to un-RAR
> (like unZip) the book.

Extracting the first without having the other two chewed up a some cpu time,
when it was done, since the file was incomplete, it was deleted.

This is a setting of your unrar program, but can be confusing if you don't
understand that it is 3 parts of 1 big file, not 3 seperate files.

> My apologies - the file hosting service is not the best.

No, it's not, but it's far better than the alternative. Thanks for
scanning it and puting it out there, it was well worth the effort to get and
keep.

BTW, if anyone reading this is in Israel, I'd gladly burn them a CD to
save the download time, but you have to come get it.

Thanks and 73,

Geoff.

Although I do not have either a schematic nor an operations manual, most generators are not designed to directly operate into the low impedance of a speaker. The speaker might act like a dead short.

They are usually designed to drive 600 ohms or higher. Some of the very small speakers may have an impedance of close to 100 ohms and may put out some audio.

But, as Edward said, the electrolytic capacitors are probably bad. Most of the old capacitors are aluminum cylinders above the chassis. They can most easily and inexpensively be replaced by cutting the leads and installing a similar value capacitor under the chassis. It does not have to be the exact capacitance and can be a bit more capacitance. New capacitors are much smaller than older ones.

Good luck, Colin Lamb

The weatherman is saying the chance of rain is 70%
for Thursday, Friday and Saturday.
So we've made the final decision to move the entire
Flea Market inside the hotel.

We've rented 125 tables that will be delivered Thursday morning.
The indoor Flea Market will be on the east side of the hotel
in the area around the Contest and Auction rooms
and in Ballroom D.
The tables will be available on a first come, first serve
basis. Each vendor will get one table for each paid for vendor
space. Vendors will be able to start claiming their tables
on Thursday, but just like in the past, there will be no
buying selling or displaying of "stuff" before 8am Friday.

So we don't have 2 flea markets, there will be NO Flea Market in
the outside parking lot, PERIOD.

Let's get ready for another GREAT Charlotte Conference.

See ya soon.

The three files added together fine. It took some time
to download because the site non-paying guests to wait
twenty minutes between downloads and I think is somewhat
slow for them. Nonetheless, I now have this very valuable
reference. Some of the HB-3 is at Pete Millet's site but its
incomplete and in the form of many PDFs, essentially one for
each tube. I think he may have some tubes that are earlier
than the ones in Knobloch's version but you can get those
one at a time. Scanning something as massive as the HB-3
must be an astonishingly difficult task and I think we owe
Ed Knobloch a debt of gratitude for doing it. Whatever the

shortcomings of the download site may be they are trivial in
comparison to the value of this work.

> If you do download all 3 parts, keep their names unchanged and put them
> in the same directory, then must unRAR programs will assemble the entire
> book as one file if you extract the first file.

I put the three files in the same directory and un-rared part 1, so getting a
214 Mbyte file.

My mistake was that I then also un-rared part 2, so getting the same 214 Mbyte file. And again for part 3.

I now understand I should have only un-rared part 1.

By the way, the rar compression is almost inexistent, because the sum of part1, part2 and part3 is very close to 214 Mbyte. Probably rar was only used to split the big file into three smaller files.

Just to double check: first tube is 0Z4A, last tube is 9006.

73

Yes, that's because the images are already compressed. They use a very high compression algotrythm, uncompressed the book would be around 3500 megabytes, instead it's less than 1/10th of that. RAR compression on top of that does not give you very much savings.

Now, if only there was a way to index it by computer.

Geoff.

Hi Harold,
Last year I regularly checked into the Sunday net on 20M- it followed the Hallicrafters net- up around 14.295-->298 as I recall. I have not heard them recently- I would check in with my TR-4CW/RIT and Kenwood D Twins if they resurface.

73,
Dale W4OP

Have you tried cleaning and lubricating the detent mechanism?  Is the
spring that holds the ball-bearing in place crusted with gunk or stretched
out?

Thanks Scott. The mechanism and springs are clean as a whistle. I'll try a
bit of lubricant and hope that works.

As clarification: it is a SX-101A, but I will consider a similar panel from
a SX-101 variant if need be.  Does anyone make decal kits for these sets???

Thanks Dave- looks like it's the same time as the 40M Drake net- but I'll
look in this Sunday- either w/ the TR-4CW/RIT or Kenwood Twins.

Dale W4OP

Hi all,
I'm looking for some info on the 2050. The parts list identifies the dsp as a modified uPD7720 and gives its part number as 351-8869-020. The ICs are labelled as 3518869020 so I assume the modification was to the die and was modified NEC as a special for Collins?

Anyone know what the mods are and whether a stock 7720 can be used as a replacement?

I was thinking about installing U14 for the ISB.

Otherwise, anyone have any of the DSP ICs 351-8869-020 available? or perhaps a complete A3 board?

While I'm at it, anyone know what U15 is/was for?

Thanks
Greg

Dear All,

There is an amazing company i came across recently is YesDeeRacks..
http://www.yesdeeracks.com

They manufacture the best Supermarket Racks.

These are the specialities of YesDeeRacks,

Supermarket Racks, Best Supermarket Rack Manufacturers
india,,manufacturing racks for supermarket display racks, Rack
manufacturing south india,tamilnadu,chennai.

And,

Yes Dee Racks, manufacturing racks for Supermarket , No:1 Supermarket
Rack manufacturing company india, chennai, and also manufacturing
racks for , departmental stores,footwears,gift
shops,pharmacies,stationaries.

And if you want to know more about this company , then checkout their
website,

http://www.yesdeeracks.com

Thanks
Have a great day
http://www.yesdeeracks.com

The uPD7720 is a mask-programmed microprocessor.  There is firmware (both
data and program code) on ROM that is on the chip.  It's not "modified,"
it's just got custom firmware on it.

>Anyone know what the mods are and whether a stock 7720 can be used as a
>replacement?

No, you cannot buy a "stock" 7720, you can only buy it with some random
software in it.  Random software is not useful.

Rockwell-Collins _might_ be able to help you.  Are you sure that the
microprocessor is bad?

I wrote a short time ago about the apparently reversed band spread capacotor in my S-40A. Here is a bit more. First, for those who did not see the original thread, I found the band spread cap in my RX had the stop pin mounted in such a way that when the plates were rotated in the direction that normal dial string threading gave they went backwards. That is, the BS dial was at 100 at minimum capacitance. This is the reverse of normal Hallicrafters practice and does not match the dial, which indicates dial-set at 0. It was possible to get the capacitor, dial, and knob to run in the correct direction by crossing over the dial string at the capacitor drive pulley. I thought the pin had been removed and replaced by someone who wanted the BS dial to run from 100 as the BS does in most other makes of RX (but not Hallicrafters).

With the help of Jeffrey Angus I was able to remove the pin (actually he did it) and replaced it with a roll pin facing the right way.

When I went to restring the dial drive I realized that the diagram in the Hallicrafters handbook _and_ in the Rider's sheets was wrong, in fact, the stringing must be done in reverse of what is shown. I then discovered that the stringing information for the S-40 is more nearly what I had. Note that in the two sets of diagrams the capacitor pulley is shown facing in opposite directions. For the S-40 the opening in the flange is shown facing up and in the S-40A its facing down. In my S-40A it appears that the pulley itself was reversed when swaged on. This would match the reversed pin position. From the photos I've found on the web the type of band spread rotor is different in the S-40 and S-40A. The S-40 appears to have a single rotor plate for each section which is straight line frequency shaped (kidney bean shaped), and two stator plates, this is similar to the cap in the S-20R, which was the predecessor of the S-40 series. The S-40A has two plates on each rotor section and a single plate as a stator. The S-40B appears from the photos to have reverted to the single rotor plate type used in the earlier receivers.

I am beginning to suspect that H my have gotten a lot of defective tuning capacitors and used them by reversing the dial stringing as I had to. My S-40A appears from various evidence to be an early one, probably made in the first run or in the first year of manufacture. One clue is the lack of a filament dropping resistor on the 6H6 noise-limiter and gas gate diode. This is absent in the Rider's sheets on the web, which are dated February, 1948, but is present in the Hallicrafter's Service Bulletin dated November, 1948. The latter indicates it is for Run No.3. My RX has an inspection stamp indicating Run No.1.

At about this time parts were still in short supply and there was still some instability in the electronics industry, which was still recovering from WW-2. That makes me think that the explanation of the cap being defective may be correct. There may have been production deadlines to meet or financial considerations that prevented rejection of the parts. Its also possible that some got mounted on chassis before any error was discovered.

In any case, it would be useful if others owning S-40A receivers would take a look at the capacitor in theirs and report what they find.

In one web site with some H history on it its stated that all of H's business records were destroyed by the Wilcox Electric Co. when they took H over. Too bad since they would probably have held the answer to this, and probably a great many other mysteries.

I also want to thank all those in this group who have been so helpful with this, and other, projects.

Hi Scott,
I should pay more attention to the data sheet. Here I was thinking todays
DSP when I should have been thinking of 25 years back. You are correct, it's
a masked processor. Ah well that ruins that idea.

No faults - Just wanted to install an isb processor - I assummed the code
was in the eproms!!

Hmm.... wonder if the masked program code can be read out to modify the I &
Q processors etc

Thanks
Greg

It's possible, there is a trick with the 8048 that allows you to force it
to output program rom (but not data rom) on output pins.  There may be
something similar for the NEC.  And it is still possible that someone at
Rockwell might be willing to provide a dump.

Just to continue with the speculation, it's conceivable that
Hallicrafters got exactly the tuning caps they wanted. A reverse
rotation bandspread cap works well enough in the S-40A and the reverse
rotation cap might have been necessary in some planned S-40 variant.

My S-40A has the reverse rotation cap. If I recall correctly, it has the
6H6 resistor.

I can't check it out right now, but I should be able to within a couple
of weeks.

I don't think so. The knob, dial, and capacitor should all rotate in the same direction. The dial must start at zero beacuse that's the marked "band set" point, the capacitor must set at minimum capacitance for the main dial calibration to operate within the adjustment range of the trimmer caps. The S-40A band spread capacitor differes from the one used in the other S-40 models and in the S-20R, which was the predecessor to the S-40 series, in that its got symmerical band spread plates, the others have straight line frequency plates. This means the rotor could rotate in either direction and still have the same "law" of capacitance variation with angle. The others _must_ turn in one direction only. One of the things I noticed is that the poistion of the opening in the flange of the main pulley as shown in the stringing diagrams is reversed in the S-40A from the position shown in the S-40 diagram. Usually, stringing diagrams are shown for the dial being at one end so that when you wind on the dial cord you have the stop to work against. This is not the case in my RX. So, I think both the stop pin _and_ the pulley were put on wrong. One can speculate about why this was done. You may be right that H specified these caps for some variation of the RX but never made it. But, keep on mind that parts were evidently in short supply when the RX was made so perhaps the caps were used and the dial string crossed over as a work-around. Note that one of the power resistors was made up of two resistors in parallel, this is mentioned in the parts list as a possibility so I am pretty sure it came from the factory. It suggests that H could not get enough of some parts and had to resort to work-arounds to meet production committments.

Again, apparently all Hallicrafters business records were long ago destroyed so one can only guess. If someone has an original insruction manual the photos may be clear enough to see how the cap is rigged, the stuff on line is too low in resolution to show this. I wanted others with S-40's of various types and vintages to have a look at what is actually in them. What I am curious about can be seen by just lifting the lid and seeing in wich direction the band spread cap moves in going from minimum to maximum.

This is all probably quite trivial in the scheme of things but sometimes its the seemingly trivial things which are the most interesting:-)

I found a tour of the Hallicrafter's plant on line. This is a WW-2 propaganda film, dated 1944 and titled "Voice of Victory". In two parts at http://www.archive.org

It has considerable detail on the construction of the BC-610 and shows some other products in somewhat less detail.

Wasn't Hawaii the 49th state?.
I thought Alaska was the 50th state, but stand corrected if I am mistaken.

My bet is they didn't need always need a heater in the back of the SCR266.
Interesting to see all the dollies and come-alongs used in production.

Also tons of other neat-o screen gems at that site. A keeper.

I am not sure what venue the film was meant for.
Probably not theatrical release. I remember seeing lots of
this sort of stuff in grammer school but this doesn't quite
fit that either.
This site also has old radio programs on it and much
other stuff.
Look for _Command Performance_ for an illustration of
how records were made c.1940. This had method continues to
this very day for vinyl records. 45's OTOH, were made by
injection molding. A very well thought out record system but
RCA just did not get the point that people wanted continuous
records and didn't like record changers. The CBS Lp was a
makeshift. Too bad RCA was so hide-bound about a lot of
things.

I have seen a version of this with a Signal Corps officer and his
introduction that described the ongoing cooperation between industry and
the military.  I would tend to agree that this was not a film for
outside distribution as its a bit esoteric for the masses.  I'll bet it
was a typical "film of interest" for the various Army signal schools.
When I was in high school, a young lady who's father worked for one of
the Government archive agencies loaned a car-load of 16mm WWII technical
training films to our school.  I can vividly remember the movie on the
SCR-506 with it mounted in trucks and other vehicles.  That's the one
that made the cover of a 1945 QST. The '299 video is a keeper, for sure,
but wonder where all the other ones are now?

Put this on Ebay. Real clean unit. It works although I didn't have it long enough to figure out how to use the coil tester stuff. I bought a package deal and am separating it up to try and help cover the LC102 I just bought. If you want to send it in for calibration, Goggle Sioux Falls on AGA. A tech there just gave out the addy for a company where this was made that does repairs and calibration a week or so ago.
It is double bubbled and then packed in a larger sturdy box full of peanuts. Your choice of shipping. Pics show measuring a 100uf electrolytic cap and set up to do reforming (can take and hour). I used it to reform that same 100uf cap in just a few minutes. Watch for an ESR meter, manuals, field calibration unit for the LC53, and other stuff this week...Thanks for reading Ebay #260388540185

The SCR-694 (BC-1306) training video is available in three parts, on Youtube
I think. I also found "Pro Patria Vigilans" on Real Military Flix

http://www.realmilitaryflix.com/public/main.cfm

They also have the Joan_Eleanor training film as well.

I found the VOV film about the BC-610 very useful for stripping down my TX,
helps to know how it all bolts together!

Back in the seventies, if you wanted a 7" pressed you could either get a vinyl pressing (like an LP) or an injection-molded styrene disk. For large runs, the styrene pressings were considerably cheaper, so the big labels used them almost exclusively. But, the vinyl pressings lasted a lot longer and the distortion when they wore out wasn't quite as horrible, so they sometimes were used for DJ promo discs and small releases.

None of the styrene systems are still running as far as I know, so if you get a 7" pressing done today, it will be on standard vinyl.

>A very well thought out record system but
>RCA just did not get the point that people wanted continuous

>makeshift. Too bad RCA was so hide-bound about a lot of
>things.

Well, the thing is that at the time, the vast majority of record sales were singles. And really, this continued until the early 1970s for pop music. A big discussion of the economics of singles vs. LP records can be found in Jim Eargle's original JAES article in the forties.

The LP was a huge advantage for classical recordings and it totally changed the form of jazz to be able to make a cut longer than one side of a 78. But the 45 sure had a lot of popularity in the pop music world for very long because they were very cheap to make, and because the form of pop music was such that people wanted one song at a time.

The CD Single flopped mostly because it was very expensive.... you could get the full album for only a bit more than the single, and so there wasn't a whole lot of demand for the single. But now in the age of digital downloads we are seeing a real resurgence in singles sales.

Interesting. hadn't realized that perhaps later versions of the
Lanchester, perhaps those built in Canada? had North American (Bendix)
electronics. Always thought that they had British style electronics
based on the T1154 plus R1155 etc. Plus the later H2S and either
British or US versions of the IFF with their explosive charges in a
tube in the middle.
I do recall some USA Bendix 'crew intercom' units on sale war
surplus.Had a bright aluminum case IIRC; whereas British stuff was
generally black (sometimes black crackle?). Two tubes, but I thought
one of them was 28D7 or something and the other was a 6.3 volt tube
such as the 6SJ7 mentioned with a dropping resistor for it's heater.
Was also under impression those units operated totally at 28 volts,
both for plate and heater voltage. probably a different unit?
Another note; later in WWII both USA and UK aircraft probably both
used SCR522, or equivalent VHF radios?

Acquired two Eddystones an 830/4 (120 kcs to 30 mcs.) and an 770R (27 mcs to 165 mcs.)

The dial cords of both are intact but both have come off the various pulleys and guide wheels etc.

At present time am taking the front off them in order to put dial cords back on but also to clean and restore these radios which are now some 50+ years old.

Any advice comment welcomed.

Cheers.

Thanks for the info.
BTW, it's "Lancaster", (you have a typo!) "Lanchester" was the classic car.
The Canadian Lancs had Bendix receivers and interphone equipment, the British had the 1155 Rx and 1154 Tx, as you said (I don't know what make of interphone equipment.) Our Rx is a Bendix RA-10DB. We found a NOS one on eBay, looks great but not yet powered up - that's the next project. Our Tx is a bendix TA-12, also not yet recommissioned.
We have two types of interphone stations (remote units) to hand, both Bendix. One is bright metal and one is dark grey crackle enamel.
Re. aircraft supply voltage: the Canadian Lancaster had a 28 VDC supply. The Interphone amplifier unit has its own integral dynamotor for heater and B+ (we're not using it to avoid wear, so P/S's will be external.) As you know, the 6V6 tube takes 0.45 A for the heater, the 6SJ7 takes 0.3 A. These two heaters are in series with the 6SJ7 heater bypassed by a 40 ohm ww resistor to take the nominal extra 0.15 A, and a 30 ohm ww in series to drop the rest of the voltage. But that only adds up to 26 volts, which is what I am using. Even then the 6V6 heater runs a bit low and the 6SJ7 a bit high - must be tube dependent (not checked yet.) Not sure if the original dynamotor gave 26 or 28 volts to the heaters.
Cheers,
Roger

Thanks for the info.
BTW, it's "Lancaster", (you have a typo!) "Lanchester" was the classic
car.
The Canadian Lancs had Bendix receivers and interphone equipment, the
British had the 1155 Rx and 1154 Tx, as you said (I don't know what
make of interphone equipment.) Our Rx is a Bendix RA-10DB. We found a
NOS one on eBay, looks great but not yet powered up - that's the next
project. Our Tx is a bendix TA-12, also not yet recommissioned.
We have two types of interphone stations (remote units) to hand, both
Bendix. One is bright metal and one is dark grey crackle enamel.
Re. aircraft supply voltage: the Canadian Lancaster had a 28 VDC
supply. The Interphone amplifier unit has its own integral dynamotor
for heater and B+ (we're not using it to avoid wear, so P/S's will be
external.) As you know, the 6V6 tube takes 0.45 A for the heater, the
6SJ7 takes 0.3 A. These two heaters are in series with the 6SJ7
heater bypassed by a 40 ohm ww resistor to take the nominal extra 0.15
A, and a 30 ohm ww in series to drop the rest of the voltage. But
that only adds up to 26 volts, which is what I am using. Even then
the 6V6 heater runs a bit low and the 6SJ7 a bit high - must be tube
dependent (not checked yet.) Not sure if the original dynamotor gave
26 or 28 volts to the heaters.
Cheers,
Roger
And remember that the British sets did not have tubes; they had valves :)

The second listing when I plugged Eddystone 830/4 into Google is a pdf article, with photos, about restoring this receiver. If it doesn't come up for you, go to www.eddystoneusergroup.org.uk and search for the model. The article is by Gerry O'Hara.

Good luck!

Quite right, thanks!  That's where I first learned electronics and
where I, too, built my first 6V6 amplifier!  Later, a couple of
Mullard 5-10's (left with an ex-colleague in the UK some 38 years
ago.)
Cheers,
Roger

Great sutff!

I've sat in front of a T1154/R1155 combo in a static display, it would have
been nice to be able to fire it up!

I bought a new (still with the RAF stores tags) "bathtub" morse key from
a firm in Essex, England, who told me they had loads of cables and connectors
and Lanc parts, even spare engines. Sadly I can't remember their name :-(
It was nearly 30 years go...

I am helping a friend dispose of his father's estate of ham gear.

We came across a working Comcraft CTS-50 2meter and 220 synthesized transceiver. These were manufactured in the 1970's and sold in the $700 price range. What is a fair price for this radio in today's market?

Many thanks for the feedback from Avery and Nelson.
I have a good 'copy' of the manual for the 830/4 that came with the
Rx.
And yes I've seen that article by Gerry O'Hara. Very informative.
But I may need some help later! So thanks indeed for the replies.

I have saved, I think, a copy of the the manual (or at least a link
to) the manual for the 770R but it's in an unusual format. So waiting
for my son to return  in a week or two, to help me print it.

I also have an 840C. (That's an AC?DC model with a chassis isolated
from the cabinet). It's off a Canadian Coastguard icebreaker and in
'hard shape'. But at least it has a case!

Neither the 830 pr 770 have a cabinet! So in the extremely unlikely
event of seeing/hearing about one; please advise.
In meantime know a local tinsmith of above average ability who  will
make 'partial cabinets' to cover top and rear.

Cheers. terry

Whatever people are willing to pay.

Their most famous rig was the 2meter one, from about 1971, with the
tuneable receiver and built in VFO for the transmitter, which was both AM
and FM at a time when FM was dominating but there likely was still 2M AM
in some areas yet the 2M AM tube gear was no longer being produced.

The later rig, I don't remember seeing a review for, though I vaguely
remember the ads.  My impression was that it didn't sell well, but it's
so long that I don't know.  I sure didn't remember it until your post.
It got less attention than their first rig.

So maybe there were few sold, in which case the price probably stays high
as a collector's item.  Of course, it may have been junk, in which case
there might be less desire.

You could try an ad on eHam; start with a price and take
offers if no one bites. For stuff like that it is a matter of
what someone will pay. I'm not sure there are that many
Comcraft "collectors" out there... Might be sentimental
value to the right party though.

Pete

It would be interesting to know how many were sold. That's a period
when there were lots of intriguing rigs in the ham magazines that
sounded so great in the ads, but it was never clear whether they
really sold. It was compounded by such rigs being produced by
really obscure companies.

Who can forget the "Brimstone 144"? The name was what we remember.
That's a rig I don't remember seeing a review for.

The "Emergency Beacon" rigs made a big splash, endless bells and whistles
at a time when there were relatively few synthesized 2m FM rigs, yet
I never had a handle on whether they actually sold many, despite the
large advertising budget.

Even the Daveco receiver from about 1964 seemed to make a bigger splash
than sales, though there seemed to be some that were actually sold.

These companies gave an illusion of being more than someone's garage,
I have no idea whether they were or not, yet the sales seemed to match
more something that was manufactured in someone's garage.

Yes Lancaster; that was a typo/senior moment cos we had a Lanchester
car also!
And had a T1154 at one point in a big wooden box; cost 30 shillings
brand new and unused in early 1950s, IIRC.
Also an 1155A . All that in the basement workshop in Liverpool.
probably learned a lot from that war surplus gear.
Then spent 40 years in telecommunications! !952 to 1992.
Still have a few types of UK valves here and dabble occasionally.
Good luck with the Lancaster project.
BTW, do seem to recall the Bendix TA12; with preset numbers appearing
```

in little windows in front panel?

I remember the negative comments in the letters to the editor in QST at
the time... the FM rig was made by Satan Electronics, and that raised
a few hackles!

> The "Emergency Beacon" rigs made a big splash, endless bells and whistles

There was some history about the guy who made the DAVCOs--its on
the W8ZR.net website. It was apparently a small operation that ran
out funding in two years.  I suspect a lot of companies were cellar
or garage cottage business's, like the old Tapetone converter line.

I'm amazed at the number of companies who made similar items in
the New England area, like the Waters products. Not much is left
regarding the history of many of those operations.

Welcome to the double hernia club, Pete!! I got a 5100 in an estate
sale 7 or 8 years ago and decided since I couldn't lift it, I didn't
need it. I sold it without ever trying it out. It had the sideband
box bolted on the side and weighed a ton. --Ed

need it. I sold it without ever trying it out. It had the sideband
box bolted on the side and weighed a ton. --Ed

Hi Ed! From what I'm reading on the net, the 5100 is a keeper.
That SSB adapter is rare, rare... Wish one came with mine. But,
the Heath SB-10 could be made to work, I guess.

Don't have a lot of room, so some of the wood beasts have to!
Not too sure on the SX-101, have you played with one? Not
overly fond of the Hallicrafters RX line on this end...

Pete

You might check surplus sales of Nebraska. Their website shows they do
have the manuals you are looking for, for a fee naturally.

Thanks, any possibility of putting it "out there" with Bit Torrent?

73,

Geoff.

I can't comment on the 5100 or the RX but I have and used a B&W SSB adaptor on a different transmitter. It works like a charm and I hope to put it back in service again some time.

There were two versions, one with a built-in power supply, and another which was meant to be used with the 5100B which supplied the power. Presumably the PS version would also work with the 5100B. The handbook has instructions for modifying several of the popular low power transmitters of the time.

\'m selling a Manson Labs CV-1694 SSB Converter. This is similar to better known CV-591 SSB converter that is used with the R-390 &amp; R-390A receivers. The CV-1694 was designed for the R-1247 receiver which was the high stability version of the R-390A for the Apollo space program. This converter has both top and bottom covers and fits in a standard 19&quot; rack. This SSB adaptor will work with any radio that has a 455kc IF. However, it needs some additional inputs: the 455kc reference signal, a 6.3v filament supply, and a 180v supply (I think). I searched the web to see if anyone had interfaced this with the regular R-390A and found some newsgroups where this was done. Though someone has written "good" on the top cover of this converter, I have no way to test it so it is sold as is. Price is $500.00 plus shipping from zip code 63105. Weight is only 9 lbs. but figure a little extra for double-boxing.

I have created a web page with lots of photos:

The combination is very good. The B&W has excellent audio and is very well built and mannered. The SX-101 is a wonderful receiver and is a joy to QSY with. I used one for years on 10 meters and it was so much more convenient to tune the band than the S-line. The later SX-101A has a product detector, but eliminates 160 meters. With a home built quad on 10-15-20 meters, I worked over 150 countries on 10 meters in just a couple of years. Of course the high bands were a bit better then.

I just started restoring an SX-101A to put back on the air. It is in good shape, but someone painted the cabinet a puke silver-green. That has to go soon.

I remember when we took this stuff out on Field Day and cranked up the surplus 5 kw generator that had its own trailer.

The only thing bad about the SX-101 I had is that when the heater came on, while on 10 meter cw, the frequency would gradually change. At first I thought it was the oscillator plate voltage regulation. But, in fact, it was the filament voltage dropping. The good news, however, was that the oscillator tube was a 12BY7 and had its own transformer (which was left on all the time). I built a voltage regulator and that sucker stayed put when my heater came on.

A couple friends had the B&W and they both sounded very good. One of them had mounted the T/R relay on the back of the B&W and when they first came on the air, you could hear the "klunk". Seems almost like yesterday. I think they were having a gas war during the summer and it was 19 cents a gallon. Gee, I am almost getting teary eyed.

Calibration is not that good, but otherwise it is a fine receiver.

73, Colin K7FM

I'm starting to feel better; I wasn't familar with the B&W
transmitter, and wanting to be able to sleep at night, I
probably offered more than most would have under the
same circumstances.

Pete

If you end up using the gear, you will not regret the bit extra you paid for it. Just forego a couple of golf games or a couple of pedicures and that covers the extra you paid.

Speaking of audio, there was a ham on 10 meters. When I first spoke with him, he had a KWS-1 and it was the best audio I had ever heard. Apparently he had some money, because I worked him with different rigs. Next, he had a Hallicrafters HT-32A. It was also some of the best audio I heard. Not much later, he got on 10 meters with a Central Electronics CE-100V. It too had outstanding audio. I was impressed - this guy had selected the three best rigs I had ever heard. I wanted one, although I could not afford any.

A while later, I was down at the local radio shop and I heard "the voice". There he was in person and I realized instantly it was not the rigs, but the voice that was so wonderful. I turned and saw a short, skilly and bald guy, in a suit and tie belonged to that voice. We chatted and I asked him if he was a radio announcer. No, he wasn't. What he told me was not impressive for me to remember, but it was something like an accountant.

As for me, when I change from my Collins KWM-380 and Heil mike to my old TCS 12 and carbon mike, people say my voice has improved. Even got one of these W2IHY voice equalizers and after long tests the listener likes it best when I restrict audio as much as possible. But, it gets through the pile-ups. And, I need not waste money on expensive mikes.

So, whether or not you get compliments on the 5100, may depend upon your voice.

73, Colin K7FM

Hi, Geoff

I'm seeding now, but it is taking forever.
I'll leave my computer on over night.

No promises - if no joy by tomorrow, I'll pull the plug.

I've never had much luck with bit Torrent.

73,
Ed

>
> The only thing bad about the SX-101 I had is that when the heater came on, while on 10 meter cw, the frequency would gradually change. At first I thought it was the oscillator plate voltage regulation. But, in fact, it was the filament voltage dropping. The good news, however, was that the oscillator tube was a 12BY7 and had its own transformer (which was left on all the time). I built a voltage regulator and that sucker stayed put when my heater came on.
>
> A couple friends had the B&W and they both sounded very good. One of them had mounted the T/R relay on the back of the B&W and when they first came on the air, you could hear the "klunk". Seems almost like yesterday. I think they were having a gas war during the summer and it was 19 cents a gallon. Gee, I am almost getting teary eyed.
>
> Calibration is not that good, but otherwise it is a fine receiver.
>
> 73, Colin K7FM

A lot of receivers have problems with unregulated filaments. After moving to a new location I found my SP-600 would take off and drift off frequency. Not broken, just large line voltage variations. The cure for that was to run it from a Sola constant voltage transformer.

Many receivers had filament regulators, usually Amperite balast tubes. These work but require a filament transformer with enough extra voltage to make up for the drop. If run within ratings they are reasonably long lived but still tend to go when most inconvenient.

There are oscillators that are immune from reasonable changes in filament or B voltage changes. For instance, a properly designed electron-coupled oscillator, essentially the type used in the Collins PTO's, but they are rare in commercial transmitting or receiving equipment.

Where can I find the torrent file?

You might want to contact the people who run "isohunt.com". They run an index site and can help you find someone who will do what fileplanet does using bittorrent instead of http download.

The main advantage of using bittorrent is that you don't have to pay to download a file, nor get the "sorry there are no free download slots" messages for hours at a time. After a short delay while they download a few "chunks", each time a users it added, it gets faster. :-)

Geoff.

You should know that Pete Millett has the HB-3 up on the web as well, at
http://www.pmillett.com/hb-3_tube_manual.htm right now.  He has it divided
into individual files for each datasheet, which is a pain if you want to
print them all out but kind of handy if you only want to look one up.

note that the HB-3 is a loose-leaf binder handbook, which RCA sent regular
updates and additions to.  Not everybody subscribed to the updates and not
everyone that subscribed to them used them, so you will occasionally find
differences between two HB-3 books.  Consequently, it's a really good thing
to have several versious available online.

In trying to replace the vernier drives in my HW-101, I made a boo-boo. I bought the metric version, had them machined, and only found out when I tried to install them into my set. OOPS!

For sale are (2) Jackson Bros (now Mainline Group) 6:1 ball drives, JUST LIKE the ones in the HW-101 and similar sets, but the 6mm type. Look here for specifications:

http://www.mainlinegroup.co.uk/jacksonbrothers/4511.htm

The shafts have been cut down to 1/4" on a lathe with a little chamfer. However, all hardware is present; hex grub screws and small brass screws for mounting a tuning dial.

Asking $5 each plus shipping.

Pete has a lot of good stuff on his site and doesn't make you wait or pay for multi-part files. He states that his version of the HB-3 is not yet complete but I haven't counted pages, it may be just as complete as the other one which is a genuine PITA to download.

I have an old WA-44C and I was going to use it for one of my science projects. The problem is that when I connected my speaker coil to the line frequency connectors and tried to change the frequency and such, nothing changed. I tried every knob on it and nothing change at all, the only thing that worked was the line frequency power output allowing me to only increase the volume.

I was hoping that some of you might know how i might be able to fix this.

If you are able to please help me. Thank you.

What is a WA-44C. If we have more details, we may be able to assist you.
Manufacturer and description would be useful, as starters.

There should be some good stuff there. Power transformers and 6146 tubes come to mind first. Then there are the small variable capacitors, feed through caps and coil forms.

Worth picking up if you are close.

Or they can put it in the trunk, and have a genuine 2m FM station circa
1972.

At this point, who doesn't have some of those chassis around?

Hello David,
I am an italian enthusiastic R390 owner. For my R390 (collins mnf
#343) I need a new RF section top cover. I live in Italy, but I am
often in USA and I have a house in Charlotte (NC), so I can receive
the item directly there! I can pay by Paypal, Credit Card or Cash, let
me what you like.
My email is
giuseppe.gherardi@cefla.it

I hope to hear you soon.

Many thanks

Giuseppe

This is commercial stuff?  VHF-HI or VHF-LO?  Anything that can be moved
to 6M?

I would hate to see it go to the trash. But I live in Pittsburgh. Would you be willing to put it on a Greyhound bus to Monroeville, or take it up to Kutztown swap meet the week before Hamvention?

I will not be making Kutztown this spring since I am going to Hamvention. Some one at Kutztown would be willing to take it off of your hands.
http://www.renningers.com/kutzradio.htm

I know these ideas require some physical effort that I am not sure you may want to do. After multiple gut operations I fully understand.

Hello All,

     There is a Collins Radio 51S-1 receiver in scrap condition
available on eBay right now. This chassis contains lots of useful
parts for Collins enthusiasts. In case anyone is interested, it is
item # 140306192715.

http://cgi.ebay.com/ws/eBayISAPI.dll?
ViewItem&ssPageName=STRK:MESELX:IT&item=140306192715

      Thanks.

          Nanu

I am in the process of restoring a Hallicrafters S-40A and have posted a bit about this already. First of all, I replaced all the paper caps. This is generally recommended when rebuilding old electronic equipment. Most of these were the original wax filled types. I measured these for capacitance and dissipation factor. D is the inverse of Q and is a way of measuring ESR but has a constant value. The result was:

One cap a dead short.

One cap open

The rest had C much higher than the marked value and rather high D, anywhere from about 0.2 to about 0.5, I think one was even higher. There were a couple of molded plastic caps, one a blue colored Cornell-Dubilier the other an Astron. These were probably replacements. Both were close to the marked C value with D of around 0.1, probably still good. The paper caps were made by Industrial Condenser Co, of Chicago and Sprague.

For comparison, new film caps measure right on the nose for C and have D too low to measure on this bridge.

The measurements were made on a General Radio Type 650A, an oldie but goodie, which has been calibrated with precision resistors and caps. The capacitance measurements are made at 1.0Khz. If I get curious enough I may check the RF impedance of a couple of these caps on a Q meter but I suspect they are not very good.

While the high C value may not seem to be a problem I suspect it may indicate some deformation of the capacitor elements or some other problem. These were not remotely precision caps when made but the values are so far off the marked values that I suspect a change in the internals rather than manufacturing tollerance.

So, the advice to shotgun paper caps seems to be right on.

Another note, probably should be a separate post.

I mentioned before that the bandspread cap went the opposite direction of any other I've seen in a Hallicrafters RX. I got a couple of responses that others also had similar S-40's. I found a couple of other oddities in my receiver (for instance someone had connected the output of the BFO directly to the detecto rather than by means of the wire "gimmic" cap, it won't work this way). I am now pretty much convinced that the band spread cap was modified to make it "set" at 100 rather than the usual zero used in H receivers. I was able to make it go in the right direction by crossing the dial drive cable but I don't like makeshifts. Also, despite the nearly symmetrical construction of the band spread cap I suspect the minimum capacitance is slightly different when its running in the correct direction. That would affect the "normal" dial calibration. The RX calibrates OK but I am still going to have a go at removing the stop peg. I think I will have to drill it out but will try something less "invasive" first.

BTW, I used to consider Hallicrafters stuff junk but after rebuilding this set and an S-20R have changed my mind. Actually both are well made and well designed. Hallicrafters definitely built their equipment to fit certain price ranges, mostly economy. I think they did quite well in delivering good performance value at the prices they aimed at. One proof is that the stuff is still working after 60 or 70 or more years.

The above really applies to the components too. While paper caps have a bad reputation keep in mind that most of the ones we deal with are very old and have worked well for a long time. Plastic film was not available when these guys were made and other types of caps, mostly tin-can oil-filled types, were very expensive in comparison to the common wax filled types. I am not sure they lasted any longer. One exception is the oil-filled molded plastic Sprague Black Beauty cap. These were made and sold as extra-high quality, long life caps but Sangamo evidenty had manufacturing problems, one of which was the way the oil filling tube was sealed. These began failing within a couple of years of manufacture where the "less reliable" wax filled paper caps went along for many decades.

I suspect the the high C reading is not due to a real capacity increase, but rather to the fact that the meter shows a C higher than real when the measured capacitor is very lossy, i.e. it has a fairly low resistance in parallel.

Anyone ever bother to check resistor values? During overhaul and repair of lots of tube era marine electronics, many composition (and films sometimes) resistors had changed value considerably. Especially those used in voltage dropping circuits. High value resistors (half megohm or more) seemed to be pretty wild too.

Of course checking frequently meant disconnecting from associated circuitry to check is a real
pain in the you know what, but the end result, (including the condenser replacements) resulted in amazing results!

Anybody find similar resistor drift?

I do check resistor values. Its typical for carbon composition resistors (aka mud resistors) to go up in value when heated and with age. For the most part these were not precision resistors although some were sold as 5% resistors. Most of those found in equipment built before about 1946 were +/- 20%. After that 10% tollerance was more usual. They can be quite far off but seldom fail catastrophically. Also, composition resistors are noisy and were always noisy even when new. IMO Ohmite were the best of a bad lot.

Older carbon film resistors often had staked end caps. The caps can develop poor contact or even corrosion at which point the resistor goes open. Many early metal film resistors used a similar method of attaching leads. If done right end capped units can be quite reliable but many were not. Another method of attaching leads was used primarily on precision resistors and high reliability parts. This was the use of conductive epoxy resin to glue the ends of the leads to holes in the ceramic core. When made correctly the break stength of the connection is greater than the wire lead. Metal film resistors can be made to have a very low or even zero temperature co-efficient and, in general, are the quietest of resistors. Both deposited carbon and metal resistors can go open if sufficiently overloaded. Military parts are tested for a seven times overload in manufacture. The bad ones sound like Chinese fireworks going off.

That might happen using a capacitance meter than does not measure the series and parallel resistance. The GR bridge does, which is not to say that you might not be right. It will measure capacitors that my Tektronix multi-meter will not measure, or, rather, will not give a stable indication on. Whatever is the case, these are bad

guys indeed.
     My main reason for mentioning this was to confirm the
wisdom replacing paper caps where they are encountered.

I do.  My general rule is to replace or bridge resistors if they
deviate 15 percent or more from their marked value.  However, if their
value isn't all that critical (e.g. a large value resistor in series
with a screen grid), I'll leave it alone.  I prefer to replace rather
than bridge; however, if I don't have a suitable replacement I'll
bridge if the resistor has drifted up in value, which is often the
case.

I have found, over the years, that carbon comp resistors go high. In some restorations, especially on radios that you just want to function, I leave the resistors alone, where they have increased in value moderately. My reasoning is that since the line voltage is higher now, a reduction in voltage caused by the higher value resistors, will somewhat compensate for the increased voltage. This would especially apply to screen and cathode resistors.

However, in critical work, it may pay to pay attention to the resistors. My Collins receiver uses a bridge circuit for the S-meter and the zero point kept changing. At first I thought it was a leaky capacitor. I checked, then finally replaced them. No improvement. I then carefully checked the tubes. No improvement. Finally, I replaced the carbon comp resistors with stable ones and the meter drift was cured.

My general method is to check them all in-circuit with a DVM. The thing is, resistors tend to fail by rising in value, rather than falling. And the errors due to in-circuit testing all reduce the measured value (since there is stuff shunted around them).

So, if the measured value is lower than it should be, I go on to the next resistor. But if the measured value is more than 10% or so higher than the value on the resistor, I'll replace it.

Sometimes I miss resistors this way, since if a much lower value thing is across it, the test is useless. But it doesn't take more than a few minutes it and catches a lot of them.

Things like plate resistors often are worries, because they are generally pretty high values, they tend to get hot, and they are in a part of the circuit where if they get noisy it'll be a problem.

I have two receivers from the 1940s which might test the memories of even the real experts.

Wilcox F3 Receiver, five tubes plus rectifier, crystal controlled fixed tuned AM receiver, rack mount. With the orginal hard bound manual. The label on the front says it is set for 5.000 Mcs. This one appears complete and unmolested inside. I am sure that the paper and electrolytic caps need replacement, otherwise looks very good.

Wilcox CW3 Receiver, five tube design plus rectifier, crystal controlled fixed tuned CW receiver. rack mount. With the orginal hard bound manual. This one lacks some covers, antenna coil, and crystal, and has loose wires inside. Probably restorable, but that will require some effort. The circuit is classic single conversion superhetrodyne. The layout is clean and has convenient access.

Is anyone interested in either or both? Zip code is 19350. I could take pictures if asked.
     Regards, cullen K5HAL

> That might happen using a capacitance meter than does
> not measure the series and parallel resistance. The GR
> bridge does, which is not to say that you might not be
> right.

Dick,

what I meant to say is the following:

At 1kHz, a 500 pF capacitor with a 500,000 ohm resistance in parallel is equivalent to the series of of 702 pF capacitor and 144,200 ohm resistior (using the well known parallel-to-seriel translation formulas).

So, if your meter has the ability to separately measure the series resistance and capacitance, it should correctly indicate 702 pF, i.e. a value higher than that marked on the capacitor.

Re my previous message, I have downloaded a GR bridge manual from BAMA. It reports that:

- the bridge measures the series capacitance
- if D is low, the series capacitance almost coincides with the parallel capacitance
- but if D is high, they differ significantly. A chart is provided to convert series capacitance into parallel capacitance.

This confirms that, if D is high and if the loss is caused by a parallel resistance (as it actually is), one must convert the measured capacitance value using the chart.

Not likely. The June 1968 issue of "73" was completely about surplus,
and right there on page 28 is an article by Hank Olson about the Wilcox
F3 (and he has an aside about the CW3 which seems to indicate they
may be quite similar. He even mentions there is a schematic for
the F3 in the CQ "Surplus Schematics Handbook".

I had a similar crystal controlled receiver back in 1972 or so, though
it was lacking markings so I never knew what it was.

If you can get hold of a copy of the "Surplus Schematics Handbook"
edited by Kenneth B Grayson, W2HDM which was published by the Cowan
Publishing Corp.(CQ Magazine Technical Series).

There were 4 models covering 1900Kc/s to 3600Kc/s

3100Kc/s to 6100Kc/s

5100Kc/s to 10000Kc/s

8100Kc/s to 16500Kc/s

This was before we had Mhz, Hi

There is a circuit and parts list in the F3 receiver in the above publication.

Lionel, VK4NS

I'm looking for a military VHF AM transmitter and receiver or transceiver such as ARC-1, ARC-4, ARC Type 12 (R-19/T-13), etc. Buy outright or I have some nice ARC-5 and SCR-274N equipment to possibly trade. Tnx
de K3HVG

I think you are looking at a manual for a later model bridge. My 650A manual has the formulas but not charts.

I remeasured a bad cap and calculated the parallel capacitance, series resistance, and parallel resistance. This is a paper cap rated at 0.02 uf. The values I got are:

Cs = 4.8 uf
D = 0.3
Cp = 4.3 uf
Rs = 994 ohms
Rp = 12 kohms

Not a very good cap.

New plastic film caps measure very close to the marked value and have a D which is below the residual of the bridge (essentially zero)

While there is an error from the rather high D it is not significant in terms of this measurement, that is, the value of the cap measures nearly three times its marked value. I have not dissected one of these but suspect the winding is distorted. That would also affect the voltage rating. What I mean is that the plates of the capacitor are closer together than originally, probably because of loss of the wax impregnant. I found other caps in this RX which had high values so this one is not unique.

I have not measured the caps at RF but I seems like an interesting project and a practical use for my Boonton Q-Meter:-)

BTW, I think my math is OK but maybe not.

> I think you are looking at a manual for a later model bridge. My 650A manual has the formulas but not charts.

Yes. However, in the 650A manual there is a similar statement. At page 3, item 9, they say that the bridge measures the series capacitance, and they also give the formula for calculating the parallel capacitance (that is what we need, as the leaky capacitors have a resistence in parallel).

> I remeasured a bad cap and calculated the parallel capacitance, series resistance, and parallel resistance. This is a paper cap rated at 0.02 uf. The values I got are:
> Cs = 4.8 uf
> D = 0.3
> Cp = 4.3 uf
> Rs = 994 ohms
> Rp = 12 kohms
>

> Not a very good cap.

Your Cp/Cs ratio corresponds to that calculated using the formula at page 3. However the other figures do not tie up with what my spreadsheet gives at 1kHz, that is:

- for measured Cs= 4.8uF and D=0.3 (that is a reactance / resistance ratio = 3.33), then Rs should be about 10 ohm, rather than 994 ohm

Moreover:
- the series of 4.8uF and 994 ohm would corresponds to Cp= 5,335 pF and Rp= 995 ohm
- the parallel of 4.3uF of 12 kohm would corresponds to Cs= 4.3uF and Rs= 0.1 ohm

I get values close enough to yours only if I set a frequency close to 10 Hz, not 1 kHz (unless I did something wrong).

Anyway, you may measure the parallel resistance of your capacitor with an ohmeter, and check that you really read a value as low a 12 kohm.

> New plastic film caps measure very close to the marked value and have a D which is below the residual of the bridge (essentially zero)
>
>   While there is an error from the rather high D it is not significant in terms of this measurement, that is, the value of the cap measures nearly three times its marked value.

why just three times? I would say that the ratio between 4.3uF and 0.02uF is more than 200

> I have not dissected one of these but suspect the winding is distorted. That would also affect the voltage rating. What I mean is that the plates of the capacitor are closer together than originally, probably because of loss of the wax impregnant. I found other caps in this RX which had high values so this one is not unique.

I will recalculate, I may have misplaced a decimal
point.

     Turns out to be a couple of misplaced decimal points.
First of all I mis-typed, the measured value is 0.048uf, not
4.8uf. Recalculating I get:

C parallel = 0.044 uf
R series   = 99.5 ohms
R parallel = 1205 ohms

    Oh, Yikes! I did it again. The correct measured value
of the capacitor is 0.048 uf, D = 0.3

I calculate:

C parallel = 0.044 uf
R (AC) series = 995 ohms
R (AC) parallel = 12050 ohms
Xc, at 1000 hz = 3315 ohms

Someone please check this.

Formulas are:

Cp = Cs / 1+D^2

Rs = D/wC where w = 2*pi*f

Rp = (1+D^2)/D^2)*Rs

All measurements and calculations for f = 1000 hz

As a matter of fact a value of 4.8uF seemed real odd to me.

Your calculations seem correct to me (assuming that by Xc you mean the reactance of Cs and not that of Cp, which is 3,617 ohm).

At this point, one would still have to explain how a capacitor marked 0,02 uF can grow up to 0,044 uF, that is more than twice its value.

Before formulating hypotheses (e.g. that the plates of the capacitor are closer together than originally because of loss of the wax impregnan) I would rather try to reconfirm the measurement results.

Measuring the resistance of the capacitor by means of a plain digital ammeter, do you obtain a value close enough to 12 kohm? Repeating the measurement on a different scale, do you obtain similar results? My experience with lossy capacitors is that the apparent Rp varies quite a lot with the scale.

Also it would be useful to repeat the test with the GR set at a diffierent frequency (should this be possible).

73

There is no DC resistance, that is, its open circuit for DC but I think there is an AC resistance component in parallel with the capacitance (have to look this up). The capacitance definitely measures high as do a couple of other paper caps from the same RX. Measured on the TEK multimeter the capacitance measures even higher. I checked the TEK meter on a General Radio decade capacitor which is known to be accurate and it measures correctly. There is definitely something strange here. The hummer in the GR bridge is definitely on frequency and it shows correct values on both the GR decade box and on single precision caps. I really think something has happened to the cap internally. Also, I am not at all sure of the tolerance of these caps originally, probably quite a lot on the high side. My Xc calculation was made for the series cap value.

FWIW, I measured several other old paper caps including a non-leaking Black Beauty. All were within reason of marked value, all somewhat higher but nothing like the one in the original thread. The dissipation factors were high compared to new film capacitors but a couple of them were probably still good caps. D ran from a minimum of around 0.03 to around 0.5. C values were within about 20% of marked value, all on the high side. Measured value of leaky (I mean the oil has leaked out) BB caps shows them to usually be on the low side.

Probably most of the paper caps in the S-40A did not need to be replaced but I had the caps and it was not a difficult job. Its difficult to know how much, if any, this improves the performance. As mentioned two caps were thoroughly gone, one a dead short and the other completely open but most of the others were probably still servicable. It would be interesting to know what the D of these caps was when they were new.

It would be interesting to know what the new film caps will be like in fifty years but I probably won't be around then (but you never know what developments there will be in medicine).

And, last but not least, thanks for checking my math.

I suspect they'll be hanging in there.  Some, actually many, of the film
caps from the 1950s are still reliable and I can only guess that modern
ones will be better still...with the exceptions of some that may turn
out to have come from crummy manufacturers.

> capacitance (have to look this up).

Well, in that case I believe that the calculations we did cannot be strictly valid. Anyway, it is an interesting issue.

By the way I also have an HT-40 and found no need for changing capacitors, as the leaky capacitors are placed where they make no harm (e.g. screen grid bypass).

I recently purchased a one-tube hb xmtr off of ebay and I'm wondering about its origins? I seem to recall this circuit being published somewhere...maybe in a newer publication?

Uses an 802 tube which is not a very common choice. Mine is new era construction and well built. Don't think I'll have any problem firing it up but mainly my curiosity is after me to recall where I saw this particular circuit?

Ring any bells?

I always consider 'leaky' to mean that they are somewhere along the road
to 'short' and just haven't arrived yet. Leakage, particularly on HT
circuits, will ultimately lead to heating and then is just a matter of time.

I figure we all have a certain mental tolerance of how much we can live
with in a certain part of the circuit but the other factor is 'time'.
Same applies to drifted carbon resistors.

The 1938 Radio Handbook (page 301) has a Reinartz Crystal Oscillator which uses an 802 tube. It features a tuned cathode circuit at 1/2 the frequency of the crystal. In that circuit, keying is in the screen. It featured low crystal current and high efficiency. Reinartz never minded re-inventing the wheel to get improvements.

I think there may have been a modern version transmitter in one of the CQ magazines using an 802, but details are real fuzzy.

Remember to put the rig on the air - it needs exercise.

Thanks, Colin. But thats not this one. Straight plain-jane cathode
keyed xtal osc circuit. Methinks its a modern project.

Hi, Hank

The 1604A bridge was featured in the Feb 1954
General Radio Experimenter.
I'll try to send the pdf file to your email adr.

73,

Ed Knobloch

It's a device for comparing two unknown impedances.  Very handy if you
want to make up a bunch of coils that match perfectly.

Not quite as handy as an adjustable bridge for determining the value of an
unknown, but if you combined it with a decade capacitor box and a variable
inductor, you could use it for that.

IET Labs is working hard on getting a lot of GenRad manuals up, on
http://www.ietlabs.com/pdf/Manuals/index.html now.  They don't have
a 1604 manual, but you might be able to request one.

You are certainly right in saying that changing the leaky capacitors would be the correct way to go from the technical viewpoint.

However I adopt a different phylosophy. I use the HT-40 (or other boatanchors radios) for maybe a few hours per year in total, just for fun. For normal operations, I use recent equipment.

So, the risk of failure caused by the HT-40 leaky capacitors is moderate. On the other hand, if I would replace the leaky capacitors, I would have the certainty (and not just the risk) of spoiling the originality of the radio.

So, in the end I prefer to leave the radio as it is, as long as it works acceptably.

Hi, Vacuumlanders,
I'm refurbishing the Bendix radios and intercom ("interphone") from a
WW2 Lancaster bomber that we are rebuilding for static display at the
Canadian Air & Space museum, Toronto.
See http://casmuseum.org/avro_683_lancaster_x.shtml
I have the interphone amplifier working on the bench using a Heathkit
variable, regulated B+ supply and a 26 volt supply for the heaters
(there are internal ww resistors to get about 6.3 volts on each
tube.) The tubes are one 6V6GT and one 6SJ7. I'd appreciate the
opinion of the experts on the 6SJ7 operating point found in this unit.
The plate load resistor is 470 Kohms, the cathode bias resistor is 470
ohms, the screen is fed from the tap between an 82 Kohms to B+ and a
10 Kohms to cathode (a 2 mA drain) and sits at +22.5 VDC to chassis
(ground.)
For an external 220 VDC applied, the B+ rail for the 6SJ7 is about 185
VDC (after a B+ RC filter.) The plate voltage is only +30 VDC for a
0.33 mA plate current. Cathode bias is 1.0 VDC. While this tube is
use as a low-signal microphone amplifier, the plate and screen
voltages and plate current seem rather low to me. While the gain,
given by (gm x RP) x RL/(RP + RL) seems good enough (not measured

other than by a "wet finger"!) and RL is certainly nice and high, does
the tube gain (gm x RP) hold up under such low current and voltage?
This operating point is so low down on the left of the tube
characteristic curves that its far below the knee of the pentode
family of curves, where they all combine, so you can't read it.
6SJ7 tube data (for normal operating points): RP = 700 Kohm, gm =
1.575 mA/volt, Thus, mu =~ 1100
In the spirit of "museum quality" refurbishing, regardless of any
better design, I certainly do not propose to change the values!
Thanks for all replies.
Cheers,
Roger
PS. I've also cross-posted in "rec.audio.tubes".

I am of the opinion the originality of the radio has been compromised when
the caps (and other parts) go bad and do not perform up to original
engineering intent. Like a Fender Stratocaster or Les Paul with an old leaky
bubble bee cap that sounds nice, mellow, fuzzy...(insert description). It
did not sound that way from the factory either. This old bubble bee is a
whole new sound. Pleasing and desirable, perhaps, but not original.

And there is the engineering part of me that says if it is not operating
with in spec it is broke.

But this is a whole other philosophical discussion.

Just my opinion,
Paul P.

The cabinets were commercially available for many years. I had a brand new
one for many years but couldn't bring myself to cut into the blank front
panel. Now if I could just remember who made it.

No markings, the cabinet's way bigger than the chassis, the chassis doesn't match up all the way to the hole in the cabinet, the coil's homebrew.

I'd say it's a reasonably well built home-brewed receiver in a commercial cabinet. Those particular tubes have been available since the late '30's, so there's no reason for them not to be original. Who knows about the chicken-head knobs -- the original owner may have put them on, someone may have bought it second hand sans knobs or felt that the original builder's knobs were ugly, etc.

The main dial is a standard National Velvet Vernier, type B, the other knobs are all standard pointer type knobs of a late version. National built the VV dial from some time in the mid 1930s until the 1950s. If the octal tube sockets are original its likely to date from the 1940s or later. I also vote for a home-brew set, perhaps based on the National SW-3.

Looking at the photos, I'll vote for homebrew or, possibly, a rough kit
of parts supplied by a wholesaler of the period. The fact that the rear
of the cabinet reveals a too large opening for the chassis and its
lopsided sort of bodes homebrew, too. Tube vintage is.. what.. octals,
late 30's or 40's? The underside may well be the answer.... Nice find,
though.

The 9th Edition of Editors and Engineers "Radio" Handbook has what appears to be the same radio in the section entitled Radio Receiver Construction. Front panel layout is the same and the tubes specified are the 6J7 and 6C5. The 6J5 was more commonly available and often substituted for the 6C5.

I expect that the interior layout will be similar to the construction article. Title to the construction article is "Simple 2-Tube Autodyne"

I have built many such receiver types and they work amazingly well. In essence, they have a product detector and readily copy ssb. I used such a home brew receiver during graduate school and regularly worked up and down the west coast. Mine was built on a plywood chassis and I used aluminum foil behind the front panel to protect from hand movement.

Having obtained a number of these National drives and dials I was wondering if anyone knows of a good source of information on them. I have googled up a number of sites that mention them in passing but I would like to get more information. Some of the dials are pre WW11 and made of Bakelite whilst later ones have black aluminium dials.

They all have the velvet vernier planetary reduction drive.

Charlie.

Those particular metal-octal tubes came out in '36 or '37 -- I have a
1940 RCA tube manual reprint, which was already touting the virtues of
the internally shielded versions.

That doesn't mean the receiver wasn't _designed_ in the late '30s, and
not _built_ until much later, of course.

I'd love to see a pic of the underside -- a really tidy job won't rule
out a really tidy homebrew, but a really messy job would certainly weigh
heavily against factory-made.

The radio does seem to be homebrew but the size of the chassis is

appropriate for the cabinet. The large opening in the rear of the case
is used to access any connections on the back of the chassis. There is
no way for a populated chassis to pass through that opening, The
chassis is mounted to the front panel and then the assembly is secured
to the opening in the front of the case.

The 1936 ARRL handbook describes a receiver which uses a pentode as a
regen detector and a triode in the audio stage. Suggested 6.3v tubes
include a 6j7 and a 6c5. As the OP suggested the rx's 6j5 may be a
replacement for a 6c5.

Look for old catalogues. Also, the ARRL has all back issues of QST on line. National was a heavy advertiser in it so you can probably find the dials there. They are definitely in the catalogue section of the ARRL Radio Amateur's Handbook. The original Velvet Vernier was a plain dial with the calibrations on the knob skirt. The later Type-B was an enclosed dial. The original had a fixed reduction ratio the later ones have a clever moving pinch arrangement so that the ratio can be changed with a small lever under the knob. both the skirted and dial types came in at least two sizes and some other variations.

I don't know exactly when the VV was introduced but it was made for decades.

Richard,

Thanks for the info, I will see what I can find. I have put up some information and pics of the ones that I have at http://www.radiowymsey.org/newsblog.htm . Mine with dials are the original design - the earliest drive has 'patent pending' on it whilst the rest have a patent number so I might be able to get a date from that.

Charlie.

Hi Charlie:

I suspect that the VV dials with the GE knobs are from the BC-191/BC-375
tuning units. They were made by GE and used the particular VV drive you had
phtos of (ceramic spacers). They probably began production in the late
1930s.

73, Colin K7FM

Colin,

Thanks very much for the info, it certainly looks as if you are
correct judging from the pictures I have googled of the two radios.
I also have one of the locking knobs shown on the BC 375.

Charlie.

There may have been another distinguishing feature of the GE VV units. It is all a little vague, but I recall that the shafts for the knobs on the GE units were slightly smaller than the standard 1/4" shafts.

Colin,

That's right, the shaft is 3/16 inch diameter - the 'output' are 1/4
inch, I assume in order to couple to standard variable capacitors.
But I think that may have been a standard feature of the VV as the
older ones I have also have a 3/16 inch shaft.

Charlie.

Thanks to all who weighed-in with their ideas.

I too feel that this is a homebrew artifact although I know in the 1930s there were many kits sold by companies that used readily available parts such as the National vernier. I am waiting for a copy of the book suggested by K7FM and will compare the schematic to what I find underneath this receiver. Frank Jones also had a very similar receiver in his Radio Handbook which is why I am anxious to compare it to the E&E Radio Handbook version but there are subtle differences in the Jones version.

Also, it was not uncommon in those days (up until the 1950s) for a homebrew project to appear in a magazine and...voila'...it soon appeared as a kit for sale in Popular Mechanics a year later, which is why I am still scratching my head a little. In the early 1950s "Radio-TV Experimenter" ran a construction article for a home "radio broadcaster/phono amplifier." Their schematic was identical and photo of their prototype was nearly identical to the Knight Kit "radio broadcaster/amplifier" that I built from a kit in 1963 as a very young kid. Old Allied catalogues show the device appearing a couple years after the article appeared. (By the way, that humble little functional toy is still in regular service to this day as I transmit old time radio shows to antique radios I have throughout the house.)

Who needs HDTV, tetrabytes and Blue ray when you've got an autodyne in the house?

The Frank Jones radio handbook and the other radio handbook are the same
thing.

At some point, I'm not sure when or why, he gave up editorship of the
book and it morphed a bit. But even as it published its last few
editions, reference was made to the humble beginnings. The 23rd edition,
from 1987 (which I think was the last), has a foreward by Frank Jones
where he talks about the early days, and then preface by Bill Orr where
he acknowledges Frank Jones early involvement.

Since it's the same book, unless one was printed in a much later edition
than the other, there's no reason to believe it's not the same article.
It's no different from the ARRL Handbook, where things would remain
multiple years, but over a long enough period of time the contents would
be quite different.

And it was never uncommon for someone to put together the parts to build specific construction articles, not so much a kit as an aid to the home builder. A company would collect the parts, maybe do the metalwork, and then the builder didn't have to track down the parts. Wayne Green did this when he was editor of "CQ", and maybe a bit after "73" started, and even circa 1971 the ARRL Handbook had an ad in the back from B&W selling kits of parts for specific ARRL projects.

For that matter, then we saw the rise of kit companies that created kits and then sold articles to the magazines aobut the projects. You could build them from the details in the article (well, up until the computer age when the schematics got too big for the magazines and you'd at the very least have to order a set of plans), or buy the kit. A lot of companies started in Popular Electronics (and the other hobby electronic magazines) this way, including what became PAIA and SouthWest Technical Products. In the ham magazines, Hamtronics did this quite a bit in the seventies, and the same company under a different name was doing it in the sixties. VHF Engineering did it too.

What happened to Wayne Green? Was he the NSD never say die) bloke? If so,
I'll always remember his detailed serve to a previous teacher who was
negligent as well as incompetent. He named him and the school and added 'So
sue me'!

```

This little radio is not marked with a makers name and the dial markers
have numerals 1 to 7 ...was that the way older 1930's era AM Radios
were marked instead of 560-1690 kc ?...I am thinking this metal case
and the rubber stamped REP 43 on back dates it pre-war..it is small
too, 6-3/8" wide 4-7/8" high and 4" front to back

```

Dane, It's a Silvertone "Metal Midget" 6002 from 1946. Google image it
to see what
the original dial looked like.

Crikey! That's Wayne all right! How does he do it? I'll email him but
probably he'll be too busy to answer... Thanks for the heads up

73 indeed

> meant to say single gang.
```

Well, the BC-221 capacitor IS single gang, ~500 pF fully meshed and would cost you hundreds if you bought it new today. It also has a superb anti backlash reduction gear. I used several in a noise bridge and bought some for $5 and one was given to me.

Thanks. But looking for simple one with no reduction gear.  Rather like the
ones used in 1920 crystal sets.

Why not cut your own out of sheet brass and silver-solder to some rod
stock? That's what kids in the 1920s did...

Name one kid in the 20s that used silver solder :)

They made some truly great variable caps in the 20s. Brass isn't really
the cats meow but the physical rigidity and thinking about the low loss
insulators and the exaggerated plate shapes for best tuning rates are a
big plus.

Not silver-plated and ceramic, mind you, but close to it :)

I'll look you up at the Charlotte fest this weekend.
You might want to consider bringing your tubes and such to the
Charlotte AWA Conference
2 weeks later. Here's a link to the conference web page.
http://cc_awa.homestead.com/Charlotte.html

Is anyone interested in some old Motorola VHF gear? I nave to downsize
and have several older tube type transmitters, receivers, and a very
heavy power supply. This will be pick up only. Zip 19350. I can barely
lift the power supply and any thought of packing for shipment is

beyond me.
Either it gets picked up or it goes to the trash forever. Speak now or
forever weap for the past.
Regards, cullen K5HAL

> http://www.oscilent.com/catalog/Category/tcxo.htm

Mine is a much taller unit, but the pin layout is similar and the
ground pins match.

```

Hi, all.
I am comtemplating the refurbishing of an R1155 receiver (not sure what model) - actually, not bought yet. Courtesy of the present owner, it's just on the bench for evaluation. Unfortunately, it is in rather rough shape, viz:
-- DF tubes missing (not really a problem)
-- Problem: Someone had started to install a 6K6 o/p tube in place of the VR101/6R7 det/audio output tube and has screwed it up badly (Not by present owner!)
-- I can't find the phones o/p transformer (designated L30) anywhere in the chassis - not even the mounting holes!
-- I don't know where the audio detector diode circuit has gone! I understand that V7 (a VR101/6R7) is the AVC detector and BFO osc. tube and that V8 (same tube type, but missing in my set), is the det/AF tube.
-- eye tube is present but almost totally faded on test.
-- I don't have any sockets for the front-of-set plugs (I'll do some work around.)

All tubes test good and I've several spares. Dial is old style, i.e. direct and 100:1, and works well.

Q1: Am I advised to replace the original det/AF tube and use an extwernal amplifier to drive a speaker, or to complete a proper replacement with a 6K6 and speaker OPT, adding a 1N34A point contact RF diode as a detector (I've done the latter on a couple of vintage commercial radio refurbishings.)

Q2: I have the schematic but would appreciate pointers to decent R1155 websites.

One last question (Q3): Is the IF 460 KHz or 560 KHz? I've seen reference to both numbers.

My objective is to retore this set for BC and SW band listening with an external power supply (which I have), audio amplifier (which I have, that's if I don't pursue the 6K6 route) and a speaker (not phones.)

Thanks for all replies and any other R1155 advice gratefully recieved.
Please also feel free to email me at "analogdino at(aboy) rogers dot
(ty as they) com" - suitably decoded!

Cheers,
Roger

Ah, ha..! I've found L30 from a VMARS sketch. I was looking for
something much larger, like a radio OPT. L30 is tiny and buried under
wires, etc!

> > One last question (Q3): Is the IF 460 KHz or 560 KHz? I've seen
> > reference to both numbers.

Ans: It's 560 KHz, from the VMARS website

(snip)

Do you, or does anyone else, have the equivalent commercial tube
(valve) type for the VR-types?
Here's what I have to date (hope the columns hold together):

Rec number	VR-type	Commercial
V1, V2, V4	VR99	6J8G (triode-heptode)

V3, V5, V6 VR100 KTW61 (NA type?) (RF pentode)
V7, V8 VR101 6R7, aka DH63 (dble-diode triode)
V10 (eye) VR?? ??
V9 VR?? ?? (double triode)

Thanks and cheers,
Roger

Hi Roger:-
Answer part by part:-
1) If the receiver was no modified, the outpot transformer for phones es L30.- In some receivers modificated has reeplaced by one R of 100 k, and attached a tetrode tube i.eg 6v6 or 6K6 for the AF amplifier.-
2) I have many years working one R-1155 with the following tubes: 6K8 or 6J8, 6k7 in IF amplifier.- 6R7 or 6Q7 in seconddetector and 1st. audio.- In the magic eye can be a EM34 european tube.-
3) Yes,the IF is 560 Khz. Will be adjusted warning the traps .-
4) The double triodo (V9) is CV1102, or BL63, not know reeplaced for the american type. It is not neccesary for the amateur use.-

I hope was be useful for you.-
Excus me for my bad english

Regards
Heriberto

Thanks, yes, I found L30 at last! Very small and almost hidden.
A 100K resistor wil no work witha 6K6 here - too high. You need a 5K
to 4 (or 8) ohms output transformer for a speaker. I did this on my
BC348.
Also, with a 6K6 where is the audio detector?
I plan to replace it with the original 6R7 and use an external
amplifier.

OK, same as mine. I have both in stock.

> In the magic eye can be a =A0EM34 european tube.

I'll look for a NA type substitue.

> =A0 =A0 =A03) Yes,the IF is 560 Khz. Will be adjusted warning the traps.

Yes, from VMARS.

Hi Roger

I have a website covering this set with key documents and can provide an electronic copy of the original RAF manual if you can't cope with the free good quality one on the WS19 website (the password procedure can be difficult for some).

My site is via http://www.vk2bv.org/radio/ and the WS-19 group manual is at http://www.royalsignals.org.uk/ then click on Royal Air Force link

This set is best kept as original as possible using an external power supply and if required, a speaker amp, if you don't use phones. These can be connected to the existing Jones plug.

Regards

Simon VK2UA

Over the years, I've tried a number of circuits to replace carbon microphone elements. None had the output voltage of a good carbon element, but they sound much better if your system has enough amplification to compensate.

Polarity could be a problem. A carbon microphone is a series DC circuit where polarity does not matter. If your equivalent circuit requires proper polarity, simply use a full wave bridge made of 4 diodes. Two of the diodes will always be forward biased. The DC source voltage will be reduced by about 1.4 volts, but that should make little difference.

Harold-

There was a thread a few weeks ago, about someone buying out Heath's remaining parts and manuals. I understand the company is still in business, just not selling kits. <http://www.heathkit.com/> If you give them a call, they might tell you how to contact the person or company that bought their old parts. There may be a slim chance your filter is available.

Hello,

I have a 2A that I was unable to get the passband tuner setup so that the pitch of the noise was equal on both sides of the center.

I setup a sweep generator, 0.1v pk-pk, sweeping from 40 - 60 KHz, in on pin 5 of V4. I setup an oscilloscope on pin 1 of V5. A marker output on the sweep generator is used as a trigger.

Doing this, I can clearly see a narrow passband that is shifted around by the twist of the knob. On the 4.8 KHz position, the passband is greatly widened, as expected.

Now, back to the narrow mode. There is ALOT of ripple on that passband, and the sides are not symetrical. One side had a slow rolloff, while the other had a far faster one. That explains the greater amount of high frequency hissing in one sideband.

I opened the tuner. Four slugs are ganged together and mounted on a spring machanism. Each slug is mounted on a coiled wire, which is soldered to the part that moves them all together. Unlike the 2B and 2C, the slugs are not adjustable. I really want the set to work correctly, so here is what I'm thinking of doing:

Take out the passband tuner, mount it to a wooden board. Take the front cover off of the tuner, and install a simple nut/bracket to simulate the action of the tuning knob. Unsolder and free the slugs. Using the same sweeping mechanism, adjust the slugs for 2.4 KHz, 6dB voltage, and as flat on the top as possible. Solder back into place, reinstall into the radio.

BUT! I remember basic troubleshooting. Failures have a cause. WHY did the passband tuner to out of tune? Caps in the circuit failed? A short somewhere? I'll find out, but I am wondering if my method here makes sense.

Comments?

My R4-B is similar. Following the instructions gets it usable but certainly not symmetrical. I have not yet gotten at this in depth partly because I don't have a sweep oscillator and I think one is probably necessary to tune this thing properly.

If you don't know the history of your RX (meaning bought it new) its quite possible someone else tried tuning it. Also, perhaps there was a little mechanical drift in the permeability tuned coils. I wish there was more service information available for Drake stuff. I am about to undertake fixing what I _think_ is a problem in the balanced modulator of a T-4XB, acts like there may be a bad diode. There is a Drake mailing list. I joined it but after getting a confirming message there has been no traffic whatever.

Hi Richard,
Join the Drakeradio Yahoo group- active and a lot of knowledge.
You may be able to use Spectrogram 16 to characterize your filter. Disable the AGC, no antenna, adjust the AF Gain for a usable trace, and run Spectrogram 16 in the peak hold mode- after several minutes, you'll have a nice plot of the filter characteristics.

Dave,

You have my respect! Far too many hams do their troubleshooting of vintage gear by first using a tube tester and then using a VTVM to compare measured voltages to a chart. I have always recommended that they first study the schematic until they understand the design fully. Then they can use this knowledge to analyze the symptoms and make an intelligent choice as to which circuits are causing those symptoms. For example. if signals are weak on one band only, there is little to be gained from working on the audio stages. Yes, your methodology makes perfect sense.

While my first receiver was a Drake 2-B, this was nearly 45 years ago, and I have no direct experience with the 2-A. But I think I can offer a few suggestions.

I doubt if any of the capacitors failed in the sense that they did not short or open. Moisture ingress over the years may have shifted their values a little to the high side however. The coils in the 2-B were wound on phenolic forms. Moisture ingress in these is very likely, particularly if they are the traditional linen cambric reinforced phenolic. Moisture will increase the shunt capacitance seen by the coils and will lower their resonance frequency. Baking the passband tuner assembly overnight at 140 degrees will remove most of this moisture. Allow the assembly to cool for several hours before testing it to allow it to return to room temperature.

I believe the coil slugs are powdered iron rather than ferrite. These are more prone to wear and having small pieces break off the ends since they are softer. Check carefully to see that the slugs are intact. A little silicone grease can be applied to lubricate them.

Before unsoldering the slugs, try adding 5 to 10 pF capacitors across one coil at a time and note if the shape of the passband gets worse or better. I would not bother with adding or removing capacitance from the coupling capacitors yet. Getting a nice symmetrical shape to the passband should come first. Then you can adjust the center frequency like Drake suggests.

One final thought - using a sweep generator and an oscilloscope can sometimes be misleading. The sweep rate should be low enough that you do not see ringing. Also remember that the oscilloscope shows voltage on a linear scale. If you have access to a spectrum analyzer with a log scale, you can use a broadband noise generator as the input signal. If you do this, you may have to average the signal over many sweeps.

If you need to trim the coupling capacitors slightly, consider the old approach of "gimmick" capacitors made from two pieces of insulated wire twisted together. I would use PTFE (Teflon) or PVDF (Kynar) insulated solid wire for longevity. PVDF is commonly used for "wire-wrap" wire.

I think your approach is the best one and I am sure you will soon have found the problem(s) and have that venerable old receiver in use again.

Extremely minor variations can cause this. It is best to sweep the filter then offset the tunable oscillators to bring things into line. Less than 100 Hz will have a great effect on the apparent noise between upper and lower sideband. I would be more concerned with breaking the filter, since you can't just replace it. The passband is variable.

Barry,

First, thanks for all the useful suggestions - I had set a slow 100 Hz sweep, and applied a little averaging on the oscilloscope for the response envelope. Alas, the spectrum analyser I have access to bottoms out at 100 kHz, so the noise generator approach is no good for me. That gimmick tip is ACE!!

I wouldn't personally discount the 'holistic' approach so generally. I know that general component degradation has occurred with many of my radios. As an example, most of the resistors in my HW-101 audio board were outside of their tolerance. Electrolytics, we all know, have a lifetime, and paper caps are known issues. Tubes do develop shorts and some leakage. It's cheap and easy work to do - during which you find the gross issues; with radios going past 50 years and several hands, I have found it more likely that not that MORE than one issue will be present. The complexity in the analysis goes up, sometimes 'by the square' with each additional shortcoming. But you are right that one has to eventually get down and perform an analysis of the operation of a defective stage to come up with ways it could fail.

My method for a restoration is: *reading the manual*, visual inspection, cleaning, switch/contact check and cleaning, tube check, capacitor replacement (shotgun replacement of all paper and electrolytic), resistor check, basic operating check, ALIGN if I've changed anything in the RF circuits, then an full operations check. I've found and repaired most of the latent issues by the time I get to the last step, and I can have a fair amount of confidence in most components being 'what they claim to be' when it does come time to review the schematic for a particular issue.

David Goncalves
W1EUJ

> You have my respect! Far too many hams do their troubleshooting of vintage gear by first using a tube tester and then using a VTVM to compare measured voltages to a chart. I have always recommended that they first study the schematic until they understand the design fully.

I am a member but your suggestion caused me to check the web site. I found it was not set to send me e-mail. That's why there seemed to be no activity. I re-set it. I also checked other Yahoo groups I belong to and found another that was not set right.

I downloaded the Spectrogram program and will try it. However, I think a sweeper would be more useful for tuning. I can do this the "old fashioned way" by plotting the response curve, that's a bit of a PITA but it doesn't have to be done often. That is on the back burner since the RX works pretty well as it is and getting the TX working right is of higher priority.

Thanks, yes, I found L30 at last! Very small and almost hidden.
A 100K resistor wil no work witha 6K6 here - too high. You need a 5K to 4 (or 8) ohms output transformer for a speaker. I did this on my BC348.
Also, with a 6K6 where is the audio detector? Answer: Not, the 6K6 is AF amplifier only.-

I plan to replace it with the original 6R7 and use an external amplifier. Answer;- OK Is a good option

I recently refurbished a Hallicrafters 5R105 and, while performing a re-alignment, discovered that on the Band 4 (14 to 31 MHz) the local oscillator (LO) is below the station frequency, whereas on the three lower bands, the LO is above.

So my question is this: Why engineer a tuning system for the high end of the shortwave spectrum to place the LO below the station frequency?

-Dave Drumheller, K3WQ

I've been going through some transformers to see what to keep and what to lighten the load, so to speak. I found one that I can't quite figure out. The thing is about the size we'd see on a 60's TV set. Nice piece of iron and useful. The issue is this: There are four sets of windings. The B+ set is easy, color and resistance are consistent with the winding. There are 3 other windings. One is identifiable as the 5v filament winding, another as the 6.3v winding, leaving what I believe is the primary (blinding glimpse of the obvious?). There are 3 wires left over for (what I believe is the primary. One black lead that pairs with another dark color wire. They ohm out as would a primary winding; that is, low resistance but an obvious inductive reactance. The bug is that there's yet a third wire associated with this pair and the resistance is several hundreds of ohms in relation to the other two. Any ideas? It can't be a CT, of course, and its way too high resistance to be a 220v tap. Also, the wire size of the "primary" is #16 and this outrider is maybe #18 or #20. I didn't just fall off the turnip wagon but this is a poser?

Apply 6.3VAC to the 6.3V winding, from a filament transformer. Now
measure the voltages on the other leads and see what they are.

Yes, the unloaded voltage will be higher than the loaded voltage. Yes,
if you energize the secondary, the measured primary voltage will be
lower than normal since the transformer ratio is set up to account for
resistive losses and you now have the resistive losses PLUS the reverse
of that step-up. The two errors more or less cancel one another out,
and you wind up pretty close to the right value.

"Why engineer a tuning system for the high end of the shortwave spectrum to place the LO below the station frequency?"

One good reason is stability. The high frequency oscillators in these receivers are less than perfect. So, by using the lower frequency for the oscillator injection, rather than the upper frequency, you will achieve a slight, but noticeable improvement in stability.

For example, if you have a 15 MHz receive frequency and a 500 kHz i.f., you could use either 14.5 MHz as the oscillator frequency or 15.5 MHz. Using 14.5 MHz would yield a 7% inprovement in stability. In addition, the coils in the oscillator, the tube and the tube socket, like the lower frequency. One other really minor advantage is that some tubes, particularly the 6C4, drops off on the high frequency end as emission decreases - so the oscillator tube might just work a bit longer.

It would be unusual. A quick check is to see if the LO is above
or below the signal at the LOW end of the tuning range. I've
quite a few shortwave sets that were properly aligned for
high side injection at the low end, and improperly set for
low side injection at the upper end of the band.
Needless to say the midrange sensitivity was practically nil.

It's pretty easy to set the
high end of dial for the wrong side LO injection because
of the wide authority range of the LO trimmer.

I can't think of any advantage--usually high side inj.
is beneficial on the lower ranges to keep LO harmonics
from falling the tuning range or the RX.

Pete

Its a real gripe of mine!  The image rejection is so poor on the top
band of many consumer grade radios that its really a moot point and the
only way to guess which side the injection goes is by evaluating which
side suffers the worse dial tracking...and often thats so close a call
its difficult to say which was intended.

Had one over 60 years ago. You are probably already aware that the chassis is not the B- or HT- connection. In other words if you have a power supply which has it's B negative (HT negative) connected to chassis; very common because aluminum can capacitors are often mounted with the negative in contact with chassis; you cannot connect the two chassis together!! So study the set diagram carefully; IIRC there is a resistor chain in the HT negative feed to produce a small amount of bias voltage. I know I made quite a mess of mine around age 14 and then had a bad power transformer which leaked 230 volts AC to the chassis. Shame really wish had it today! Mine had the Aluminum case, and the older style dial. The 'Odd' BL63 double triode powered the DF meter I think. The EB34 double diode was much the same, I think as a 6H6?
Good luck

So in the end and after spending about 20 bucks for drills and about 2 hours trying to drill it out, I got serious. I took another trip to the depot and picked up a cutting wheel set for my Dremel, a Bernzamatic pencil torch and fuel. I had the three remaining hex nuts coaxed off in less than 5 minutes with a little heat, The snockered up hexnut was out in another 2 minutes.

So if you're going to have to take out some of those hardened buggers I would apply a little heat if they give yu any resistance. Torch was $9.99 and as far as I am concerned a very good investment. Dremel cutting wheel set was another $13 and likewise a good investment.

regards,
NEO

If you weren't across the continent I'd back my pickup up to your pile,
as a handy place for you to put the rejects...

I am looking to buy the meter that is on the front panel of a Johnson
Viking II. I bought the radio on Ebay and kind of got ripped off since
it has no meter. It is for a birthday gift for my husband. I am not a
ham myself and have very limited knowledge so I am throwing myself on
the mercy of you kind folks and hope that someone can help me. I hope
this is the correct place for this posting and apologize if it is not.
Thank you!

"The image rejection is so poor on the top band of many consumer grade
radios that its really a moot point and the
only way to guess which side the injection goes is by evaluating which side
suffers the worse dial tracking..."

Right. I recently went through just this problem. Radio had been twiddled
with. The service information said nothing about whether low or high side
injection was used. I used the trial and error method to figure it out. I
looked through two different service instructions and both were silent.

The good news is that single conversion radios, with 1 rf amplifier stage,
are rarely used above 20 meters anyway, these days.

All of my handbooks from the '40s through the '60s have converters to
take the signal down to 40m or below, for just that reason.

20MHz down to 0.455MHz is just a conversion too far.

I remember one review for a low end receiver, and I can't remember which
receiver or which magazine, and they outright said there was so little
image rejection that they couldn't tell which was real and which was
the image.

On the other hand, I recently reread a review for the Radio Shack sw
receiver from the late sixties, transistorized and something like the
DX-150, and it praised the receiver for it's image rejection even on the
highest band. I suspect it was thus a very generous review.

Of course, that's apples and oranges. The frequency of the IF factors
in, and it's not the single conversion that matters, but the signal
frequency versus the IF frequency.

Kinda yes, kinda no.  It's much easier to get a high 1st IF and a nice
narrow overall response in a double conversion superhet than a single.

Having said that, my Galaxy 5 worked pretty well with a 9MHz IF and
single conversion.

Apples and oranges since the Galaxy made no attempt to cover BCB range
ad certainly had no BCB parallel.

3200 kc Infradyne comes to mind as a "high IF scheme" for BCB but I
can't think of any older single conversion rig that used a high IF freq
for BCB? Ok, theres some 1600-17oo kc schemes. The older mindset was to
go lower in freq for improved Q.

It is not a moot point... Usually the bottom tracking is fixed on
the higher bands (no padder or slug for the LO coil).  If the LO on
the  high end of the dial is set to the wrong side,
the mid band sensitivity will
be Zilch. Usually checking LO frequency on the lowest end
of the dial will show if it is supposed to be hi or lo side injection.

I had this exact problem with the Hallicrafters 5R10A.

With my signal generator set to 30 MHz, the image at 30.91 MHz was maybe 1 dB lower. However, when I set my generator to 15 MHz (the low end of Band 4), the image at 15.91 MHz was much less noticeable. So, the set is a reasonably good performer so long as you avoid using the high end of Band 4.

Hi. I'm looking 1920s UK wireless parts, particularly the two pin
plug/sockets for 'What are the Wild Waves saying?" Igranic coils. They have
one male and one female connection. Any ideas for a suitable newgroup, if
this isn't one?

This is an appropriate group but you may have better
luck at rec.antiques.radio+phono

I had this exact problem with the Hallicrafters 5R10A.

With my signal generator set to 30 MHz, the image at 30.91 MHz was maybe 1 dB lower. However, when I set my generator to 15 MHz (the low end of Band 4), the image at 15.91 MHz was much less noticeable. So, the set is a reasonably good performer so long as you avoid using the high end of Band 4.

-Dave Drumheller, K3WQ

I had this same problem tuning up a Hallicrafters S-20R, this RX goes to 44 mhz with only one RF stage so the image rejection at the top frequency is almost nil. Hallicrafter's did use an LO at lower than signal frequency in some cases, for instance the S-36, a receiver that goes up to about 143 mhz has the LO lower than signal frequency on the top band only. The IF is about 5 mhz so the 10 mhz difference probably made it easier to get sufficient LO output. The S-20R appears to have the LO at higher than signal frequency on all bands. The performance and calibration are slightly, but noticably, better with the LO on the correct side. Hallicrafters made some receivers with no RF stage but tuning to the 40 mhz range, they probably have no detectable difference in response between desired and image signals. There should be a slight difference in the dial calibration but it may be masked by drift in the oscillator coil.

BTW, while many of these receivers had no adjustment for the low end of the oscillator or RF stages its usually possible to tune them by adjusting the coils. For instance, on the S-20R the turns are held in place by wax so its possible to move them around a bit and fasten them back down again by either re-heating the existing wax (with the tip of a soldering iron or a concentrated heat gun) or by melting a bit of new bee's wax (can be had from art supply stores) onto the coil. Some RX may be found to have an adjustment section on the coil or sometimes an isolated shorted turn that can be moved around to adjust the inductance.

In addition to what Richard said, try www.radiomuseum.org.  It is a European
based site with a lot of UK knowledge among the members.

I appreciate all the comments and have applied them to the issue. I fired the transformer up and it does function, generally as expected. The B+ bridge type winding puts out about 350v, unloaded. I expected the one of the two filament windings (green) to be 5v but they both and put out over 6.9v unloaded. The green winding puts out a good 6.5v with a 5v rectifier tube filament wired to it, so it must be a healthy 6.3v winding, instead. The outrider wire on the primary winding appears to color code out as a "primary tap", using the link provided by Cmdr. Buzz. Maybe the extra wire is, indeed, a 220v winding. If I could remember from whence it came??? Again, thanks to all. de K3HVG

You're in the right place.... but... the bad news is that if the
meter is missing, odds are that other stuff is missing too.

I'd first contact the guy on Ebay.... if he said it was in good shape
and the picture in the ad showed a meter, you have a right to a machine
in good shape with a meter.

The guy at Tubes Tubes Tubes has parted out a Viking II.... he wants
what I think is an insanely high $30 for the meter, but you can contact
him at xfmrs@roadrunner.com. He probably has any other parts you'll need
but you'll pay highly.

If you go to bama.sbc.edu, you should be able to download the manual
for the thing. You will need to get the djvu decoder because bama uses
a somewhat old and unusual data format. But they have the manuals and
they are free.

There are also some modifications for the machine out there, including
a PTT mod and an audio modification that increases the gain. It is worth
downloading those as well since any random Viking of unknown provenance
may well have had the modifications done.

What voltages are you reading on the "primary tap" when
testing? It should work as an autotransformer to give
some idea if it is indeed a 220 volt winding or 110 volt
tap.

Also, the lighter gauge might make more sense
considering that the primary current would be 50% of
what it would draw on 110 VAC when using the 220VAC
winding.

Pete

Hi Jak,

Nope.  I took the remaining three screws out and cut the coupler in
half the long way.  I drove the grinding wheel straight through the
hardened steel screw - no problem.  I've used the Dremel tool when in
an emergency situation working on exhaust systems.

regards,
Bob

I have what looks to be an all but NIB condition BS-5 panadaptor module just removed from a Kenwood SM-220 scope. I bought the unit to use as a monitor scope, only, and can't use the module unless I build a mixer. If anyone's interested, I'll entertain offers. I'll check the usual venues to see what the going price is and make sure I'm below that level... to be sure. Tnx de Jeep/K3HVG

I have recently bought a hi-quality multimeter (AVO eight, mark VI) built in 1984.

The multimeter gives low readings (-15%) on all AC and DC ranges. After many checks, I have fully isolated the movement and I have determined that it goes to full scale with a current of 44 uA instead of the nominal 37.5 uA. I have carefully checked that there is no shunt in parallel.

I presume there must be some way to adjust the meter sensitivity, but I am not sure how to do it One way could be to reduce the tension of both helical springs, but I am afraid I would not be able to recover a 15% loss that way.

On the other hand I do not think the problem is with the magnet aging, as I have an older AVO multimeter (model eight, mark 2) which was built a few decades before and still works perfectly.

Morever, the question arises why the meter sensitivity has degraded.

Any help?

Tony I0JX

Hi Tony:

I do not have a good answer for you, but do have a couple of suggestions.

1. Do not assume that because a magnet used by the same company decades earlier is good, that the magnet made later is also good. Often, in production, later manufacturing methods are developed to save money. I have also seen where production methods are changed and for a few years, the material has limited lifespan, then the company converts back to the original method.

2. Check to determine if the same lack of sensitivity occurs at the low end of the meter. If not, that might indicate a mechanical drag.

3. I salute your willingness to explore new areas of restoration, but make sure, before you operate, that you have the right organ.

73, Colin K7FM

Here is the ebay ad she bought from (I'm guessing):
It shows no meter, and was advertised as a "project" radio
by RadioMart -
http://tinyurl.com/d6xlg4

I think she's out of luck in pursuing the seller,
the photo shows no meter present.
It looks pretty complete, although the missing 807 tubes
may be a bad sign. The price was OK for its condition,
I believe, assuming the transformers are good.

Note: do +not+ plug this in to see if it lights up!
It will require some preliminary testing by a ham to ensure that
the power supply capacitors aren't shorted due to age, etc., to avoid
unnecessary damage. It may not have been powered up for 40 years.

73,
Ed Knobloch

If the bare meter movement is showing a loss of sensitivity, my
first guess would be a weakening field magnet. It would be a
bit unusual for a modern instrument, however....

Most of his sets are all too often "project radios" from what
I've seen posted.

> 73, Colin K7FM

Thank you for your suggestion.

After completely disassembling the multimeter, I got access to the front spring of the movement and noted that first turn had just overlapped the spring binding post, possibly due to a shock. Just touching the spring, it went back to normal with no deformation at all. Now the full scale current is exactly what it should be.

What amazes me is that I could not find any visible adjustment point (e.g. a variable magnetic shunt). Evidently they were able to produce very precise meters requiring no adjustment.

Yes, the whole key to the thing is that the number of windings is the only
thing that actually controls the sensitivity. D'Arsonval figured this out
a century and a half ago and we still use his mechanism for most meters.

Good find. Better quality meters were rated to 1 or 2 percent at FULL SCALE.
Also, many are rated for mounting on a steel panel. Many are not so rated.
The presence of external magnetic fields WILL affect the reading.

Sometimes you just have to go with the real meter indication and re-mark the
scale to the correct numbers.
I've done that a number of times, it shows the non-linearity of lesser
quality meters.

And don't forget the static charge on the plastic or glass face after you
spotlessly clean and polish it.  A little spit may help.

Hi,
I picked up a Weston type 301 5mA d.c. meter marked for use
with a 1/8" steel panel.
I find it takes about 6.1 mA to deflect to full scale
without a panel. That sounds as if the presence
of a surrounding steel panel would increase the meter sensitivity
by about 20 percent.
Could someone explain this, please?

Thanks,
Ed Knobloch

Looking for World Radio Amateur Magazine issues:
June 1960
June / July 1961
August / September 1962

or any issues with column by Ed Marriner, W6BLZ (SK) about SSB
transceiver project based on BC-453.

Would like to buy issues or borrow to scan into .pdf format and
publish on Internet.

I trust what you write, but it is difficult for me to understand why the meter sensitivity is not affected by the counter springs tension.

FS: A very nice Kenwood model TS-180S HF transceiver.It covers 10-160 meters(no WARC bands) and has 100+ watts output on all bands. It comes with the Kenwood model MC-30S hand microphone, the original manual for the rig, and the power DC cable. The transceiver works great and looks really good. The digital readout is bright and clear and the dial lights are all good. There are a couple of small scratches on the top of the cabinet,but overall the cabinet looks very good. The front panel is near perfect. Price is $295 plus shipping. Digital pictures available. Thanks, Charlie Hugg, K5MBX

Does anyone know of a source for an aerosol can of Heathkit cabinet paint in the color used on some of their later antenna tuners such as the SA-2060A or SA-2500? (I would descibe the color as a grayish-bronze color)

Thanks   Ed   K2ZE

Hello and thanks for the read.
A friend has 2 auctions for these power supplies for working on Boat Anchors. 6/12 volt filament connections and 0 -150 DCV & 0 - 400 DCV connections, with volt and current meters. Search Eico 1030
Search Paco B-12.
Auction ends Sunday evening.
Larry

Best bet is to bring a sample to a local custom car paint shop and have them
custom match it and put into cans.

It cost me $25 for the color match and paint and 5 ea for the 2 spray cans.

I have for sale a Henry 2KD Classic Desktop HF Amp in beautiful condition for $1200.00 dollars. The amplifier has 10 meters installed and comes with the original manual. It has a pair of full output Eimac 3-500Z tubes and is setup for 220 volts. I can send digital pictures upon request. Due to the weight of the Amp, I would prefer a pick-up or could deliver to the Midland or Weatheford, Texas Hamfest in March and April. Thanks, Charlie Hugg, K5MBX

Any info on this early PLL rig? I have two and some parts from a third
and would like to begin restoration, not far to go with rebuild the
two!
The 623 is a 23 channel AM/SSB CB transceiver with discrete PLL
(several early descrete chips) and is somewhat modifiable. Has multi
turn voice lock, single 12JT6A final with about 15 watts out (PEP).

I have for sale a couple of exceptionally nice Heathkit HF Amplifiers. 1st is a Heathkit SB-221. It is near spotless and puts out full power from a pair of Eimac 3-500Zs. 2nd is a Heathkit SB-200 that is in similar condition and puts out full power from a pair of Cetron 572Bs. Price for the SB-221 is $675 and the price for the SB-200 is $425. Prices do not include shipping costs. I can also deliver to the Midland or Weatherford, Texas hamfests in March and April. Digital pictures available. Thanks, Charlie Hugg, K5MBX

Hi Charlie

WOuld you happen to have a filament transformer for a 4-1000
tube you might want to sell? 7.5VCT @21 Amps?

73,

Jim, WA5DXP

Although I have never been involved with CB, the Utopia is a very nice
looking rig- patterned after the Hy Gain GT amateur series. I have often
thought it would make a  fine 10M vintage rig.
Sorry, no info on the "innards"

I am in the midst of restoring a Hallicrafters S-40A. I think someone has changed the stop on the bandspread capacitor. AFAIK all H receivers have the bandspread set at 0 and this represents minimum capacitance. On this RX 0 has the bandspread cap completely closed and the frequency calibration can not be brought in. If set at minimum it sets up fine. There are other signs that the bandspread cap has been fooled with.

I have seen one picture on the web which looks like the dial pullies have been strung to correct a similar problem. This is not what is shown in any of the S-40 series service material. My question is: will someone confirm that the S-40 series bandspread cap should be at minimum with the dial at 0 and has anyone else encountered this problem?

The peg which forms the stop seems to be firm in its socket. If its sticking out on the wrong side I may have to restring the dial pullies to compensate. Thanks for any help.
